Progetto ITACA

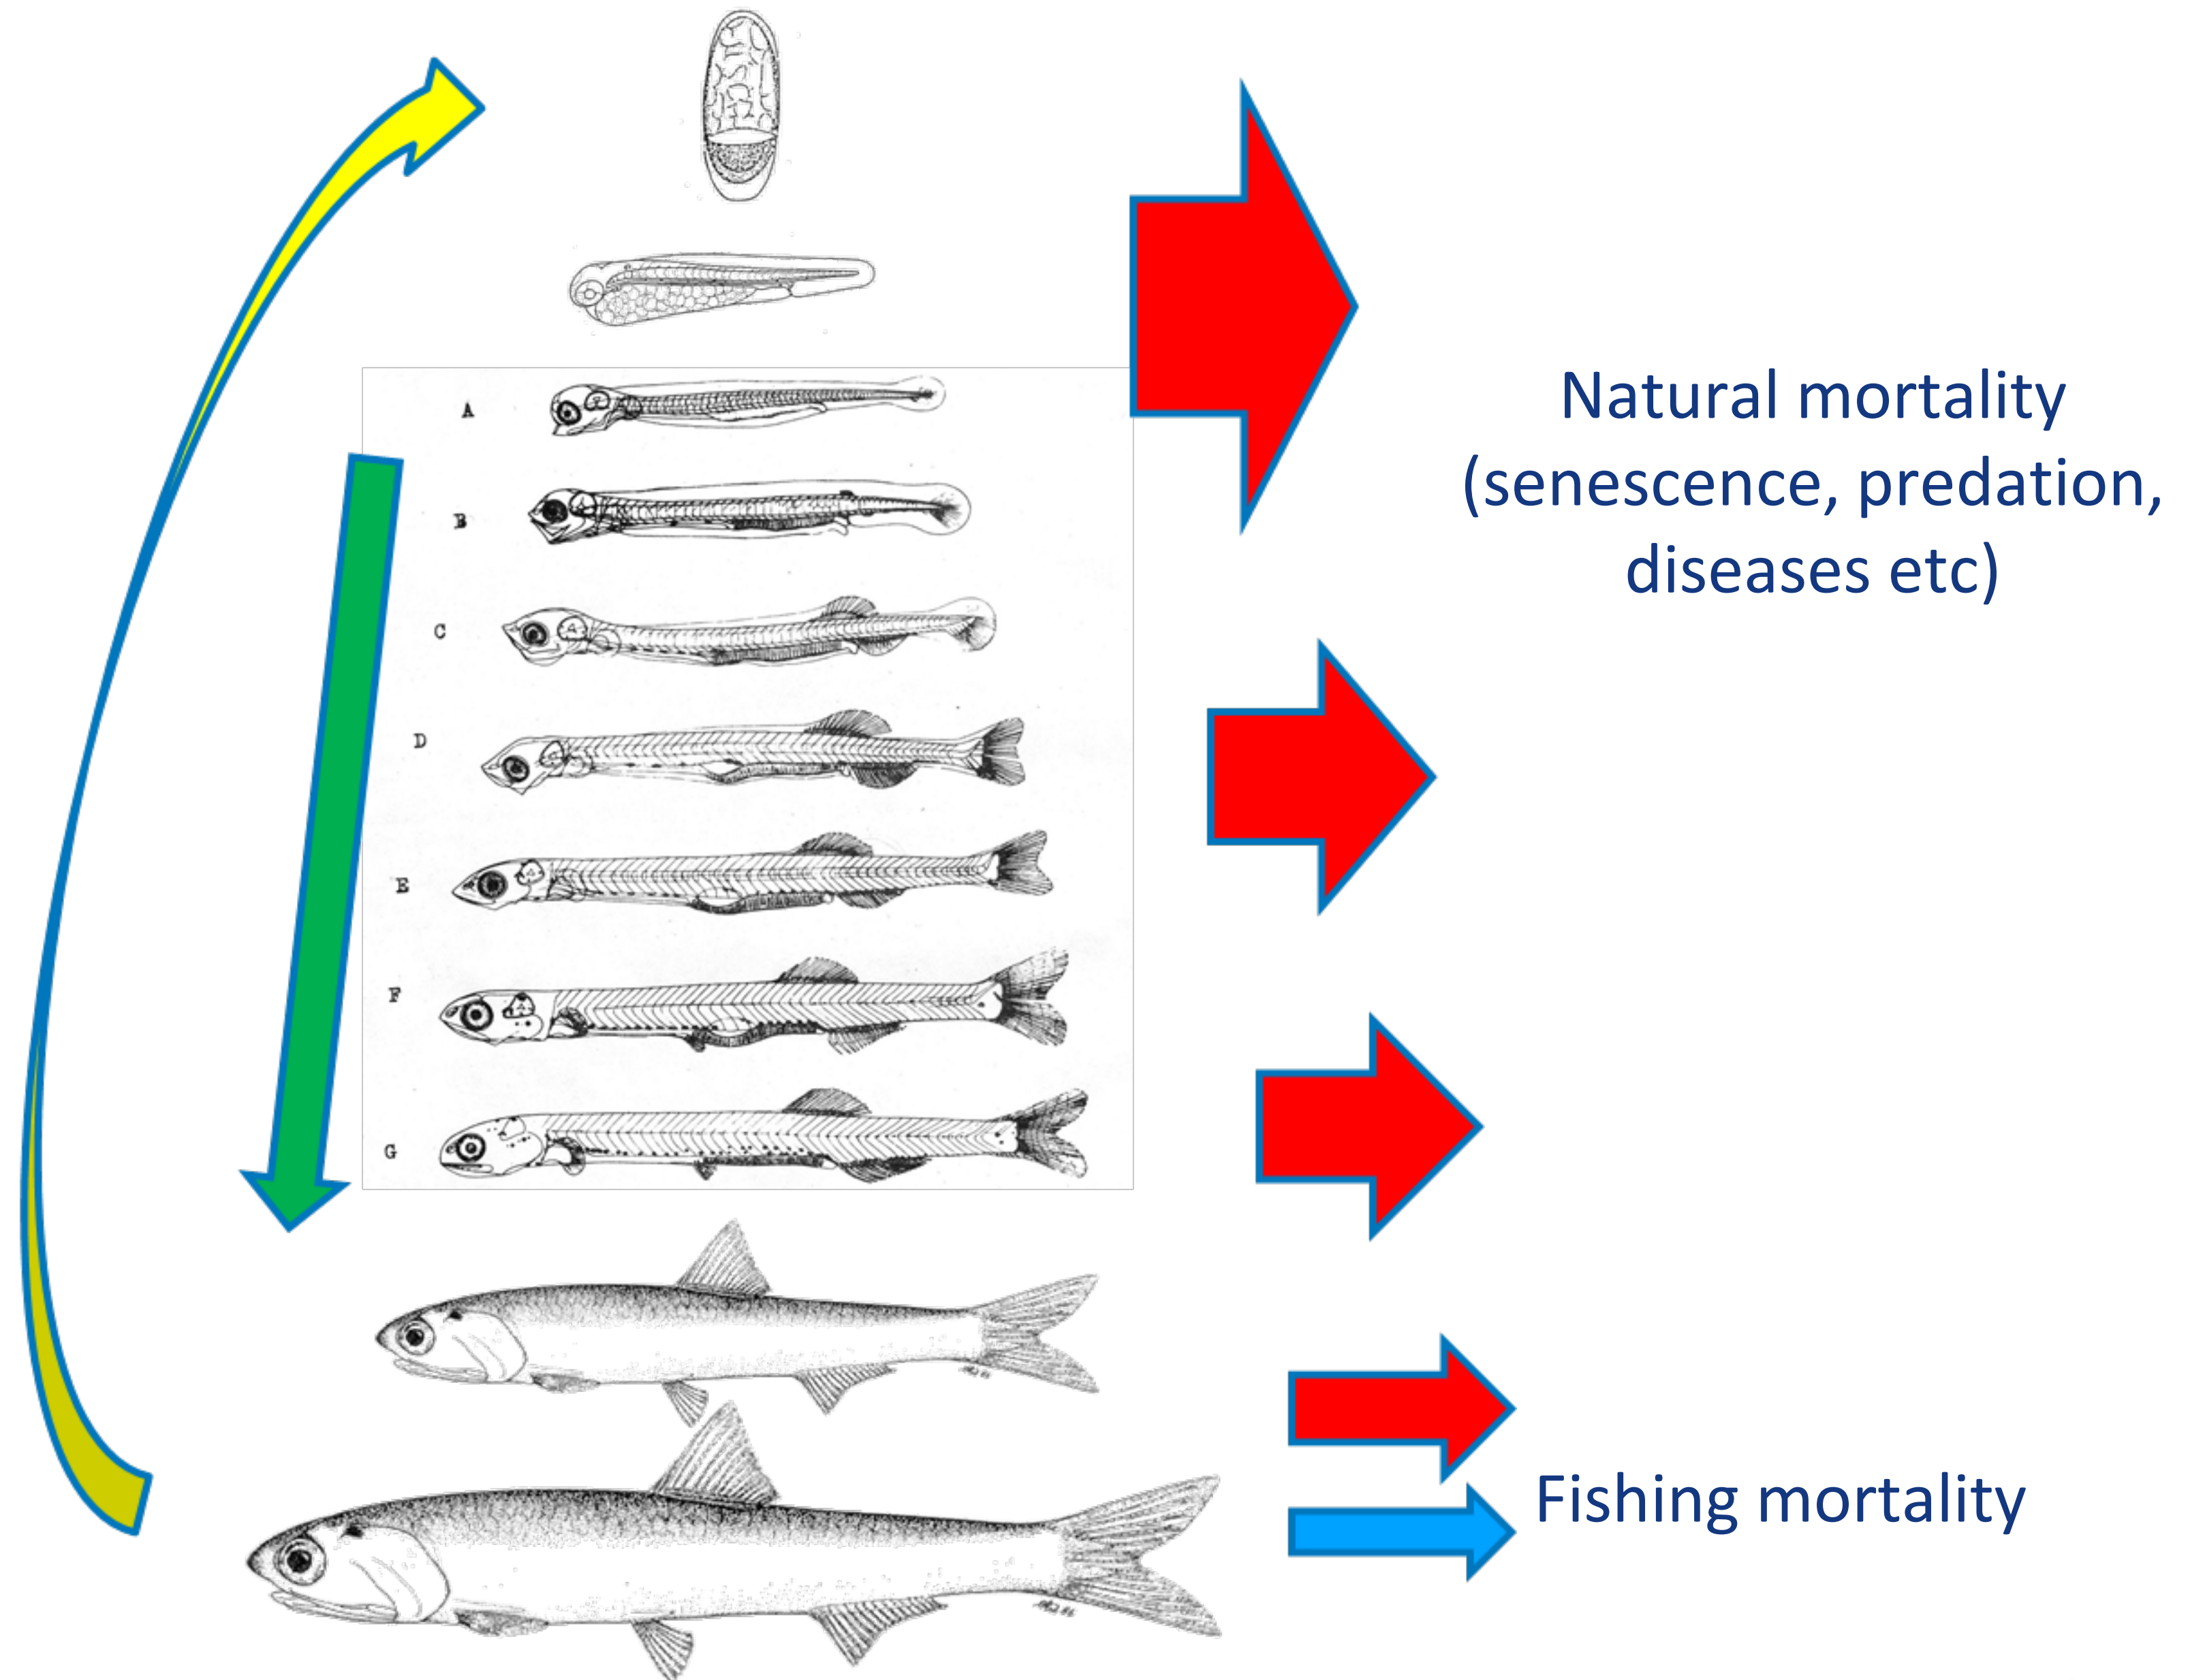

Life cycle

GROWTH at all life stages >> depending on prey availability; environmental conditions;

SURVIVAL at all life stages >> depending on fisheries pressure, on predators abundance, on env conditions

RECRUITMENT >> depending on mature adults (SSB), environmental conditions

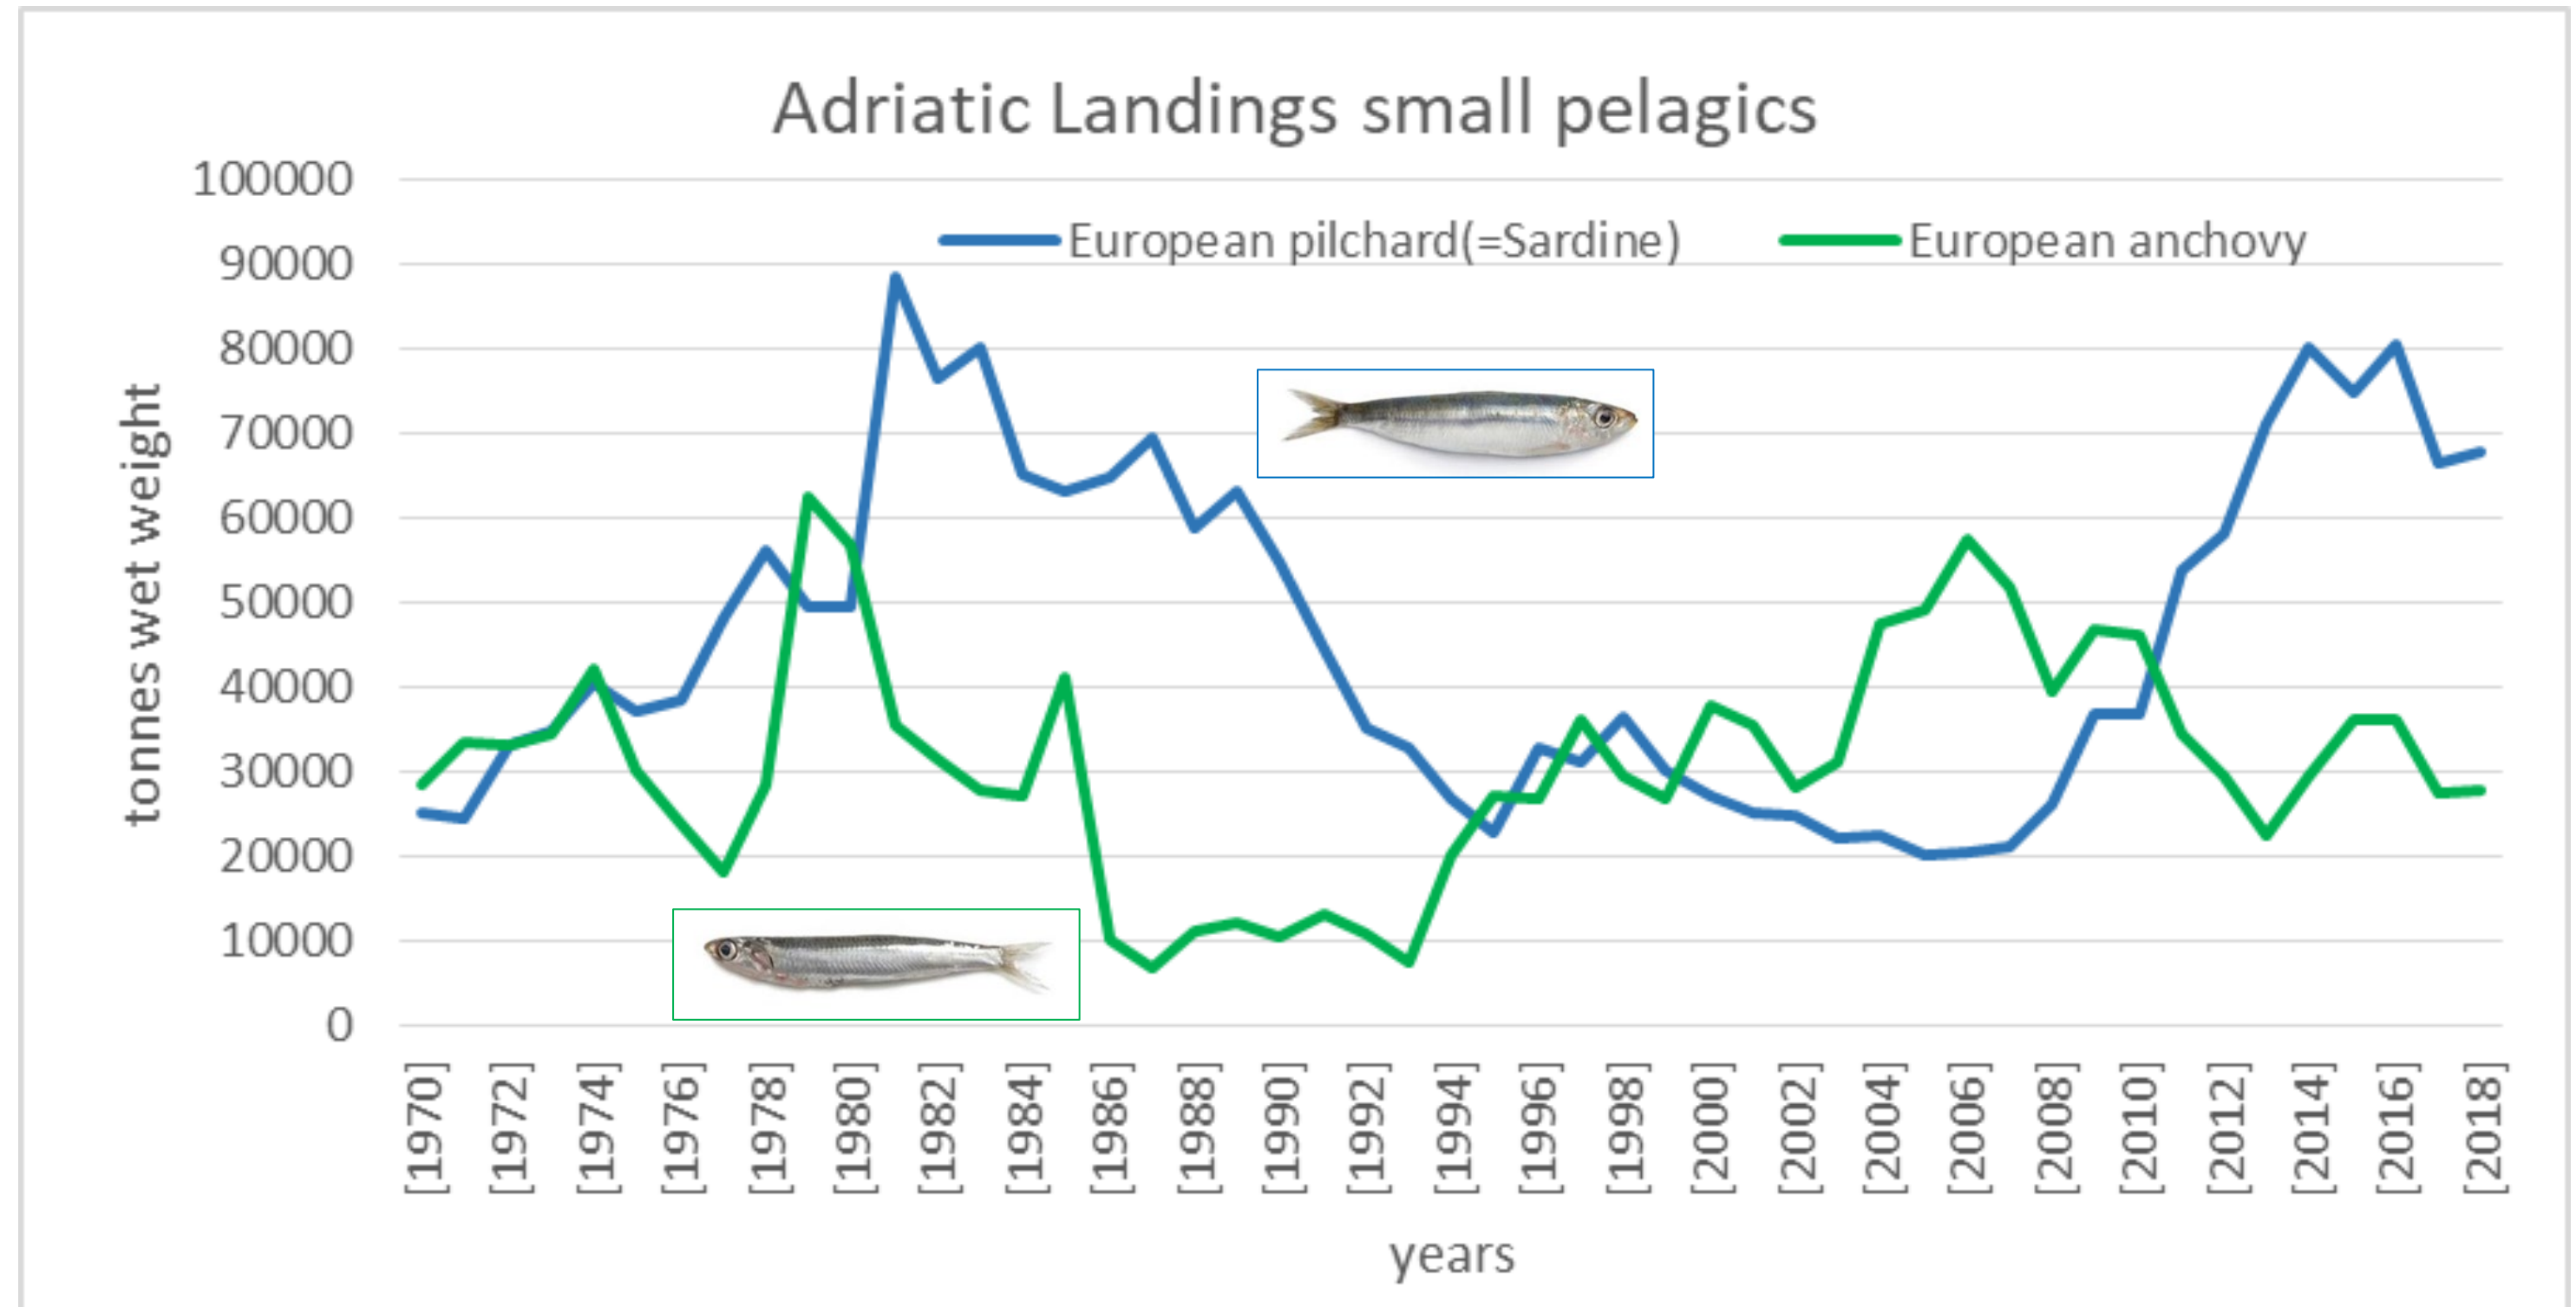

European anchovy or, more commonly, anchovy (*Engraulis encrasicolus*, Linnaeus, 1758)

European pilchard or, more commonly, sardine (*Sardina pilchardus*, Walbaum, 1792)

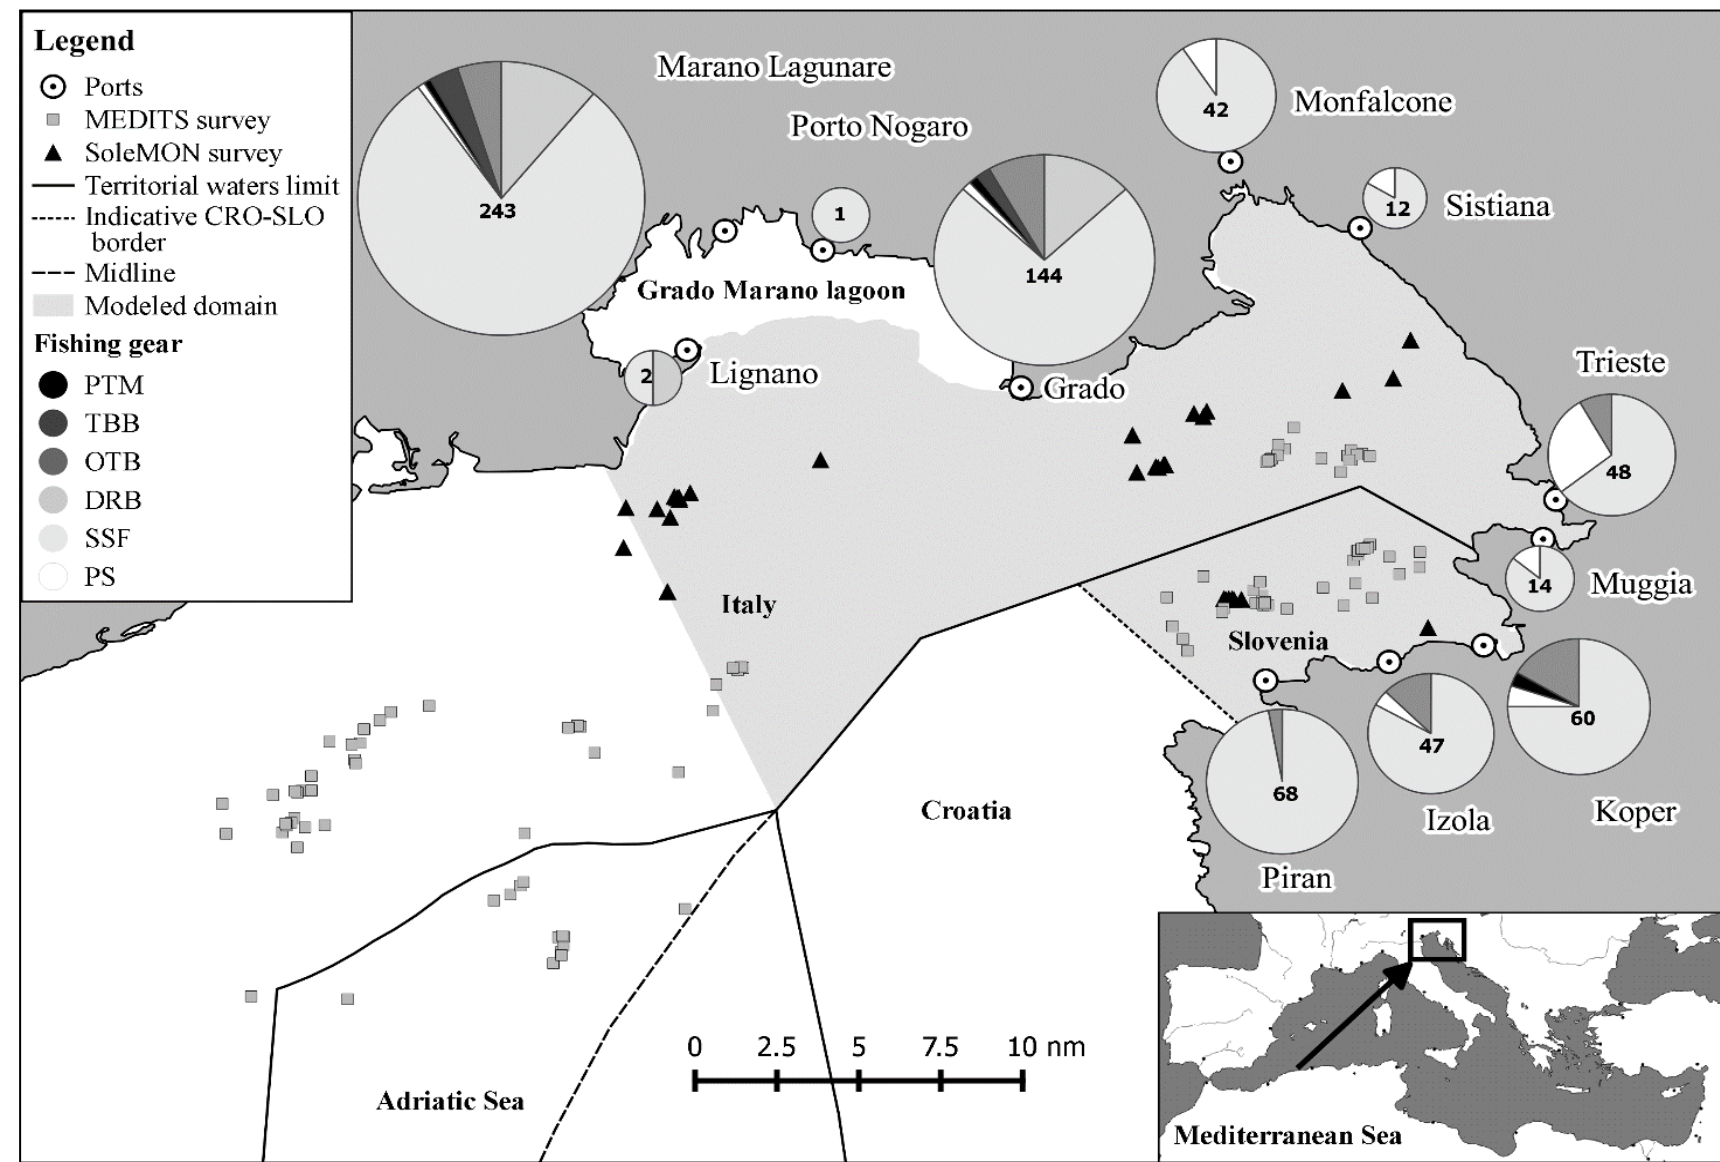

Dynamics over time in the Adriatic

Why?

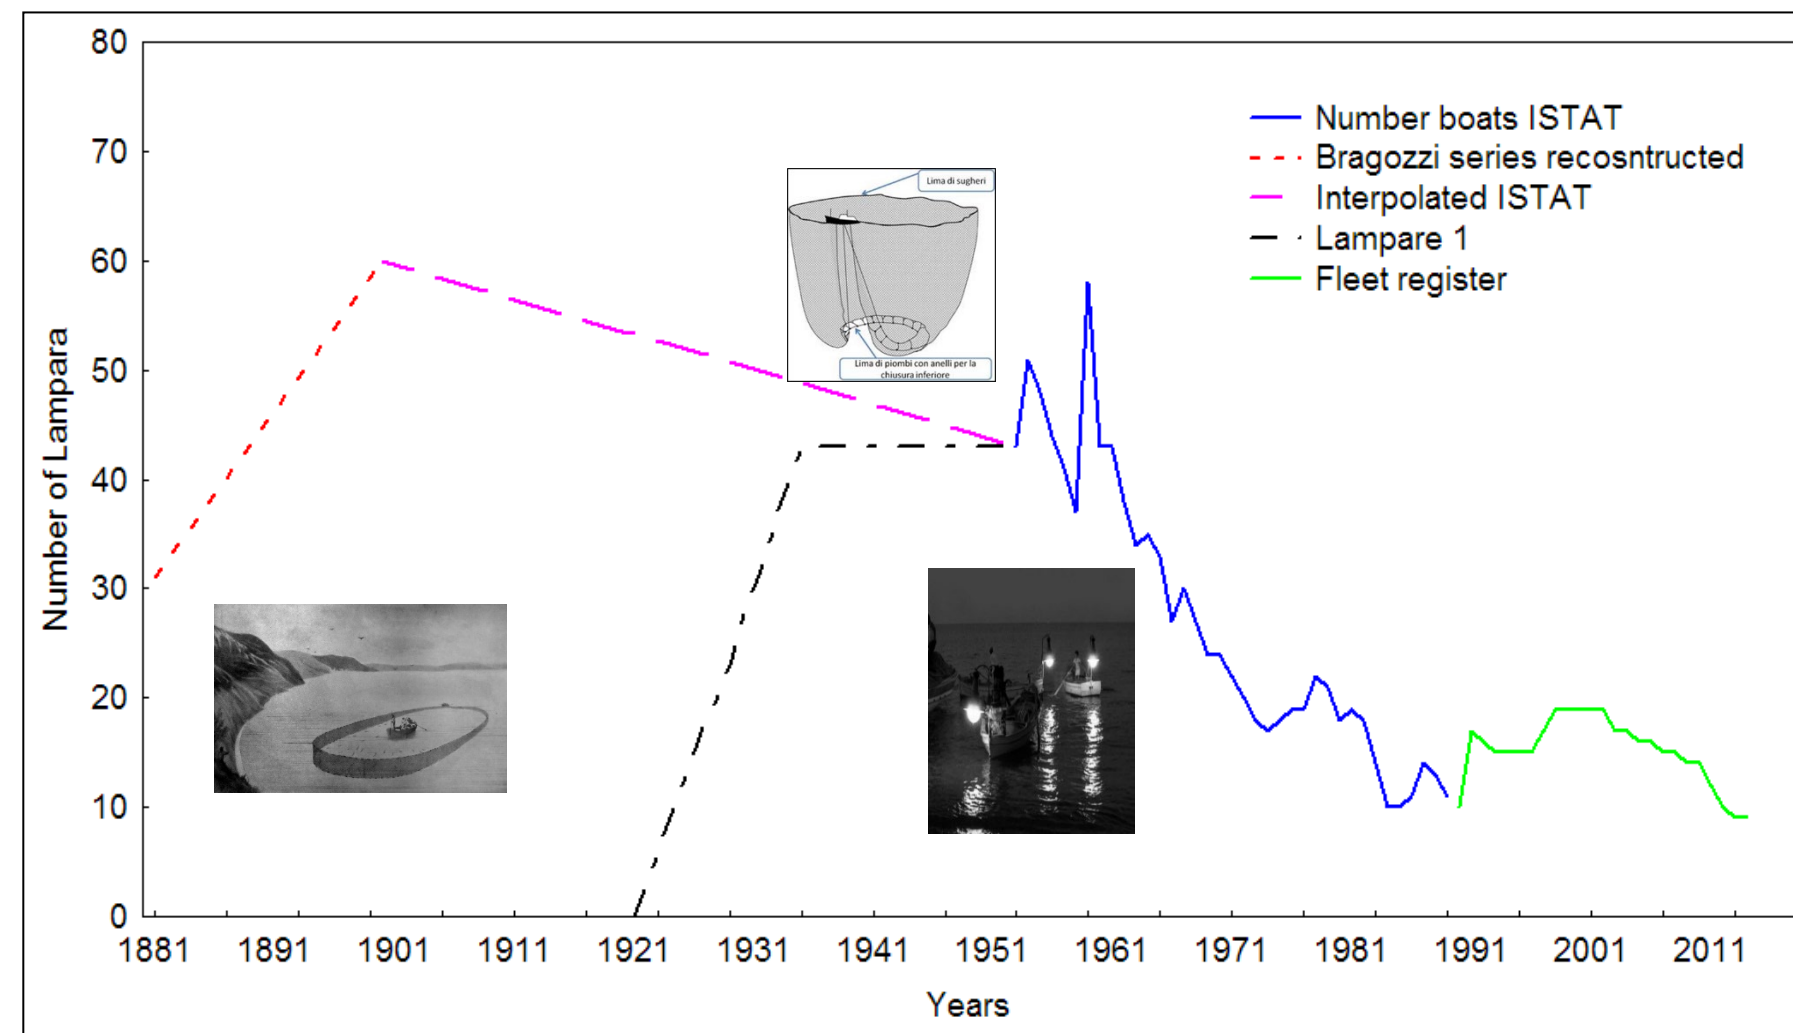

Data from: FishstatJ+ (GFCM regional database; updated 2020)

Long term changes: the case of Lampara in Trieste

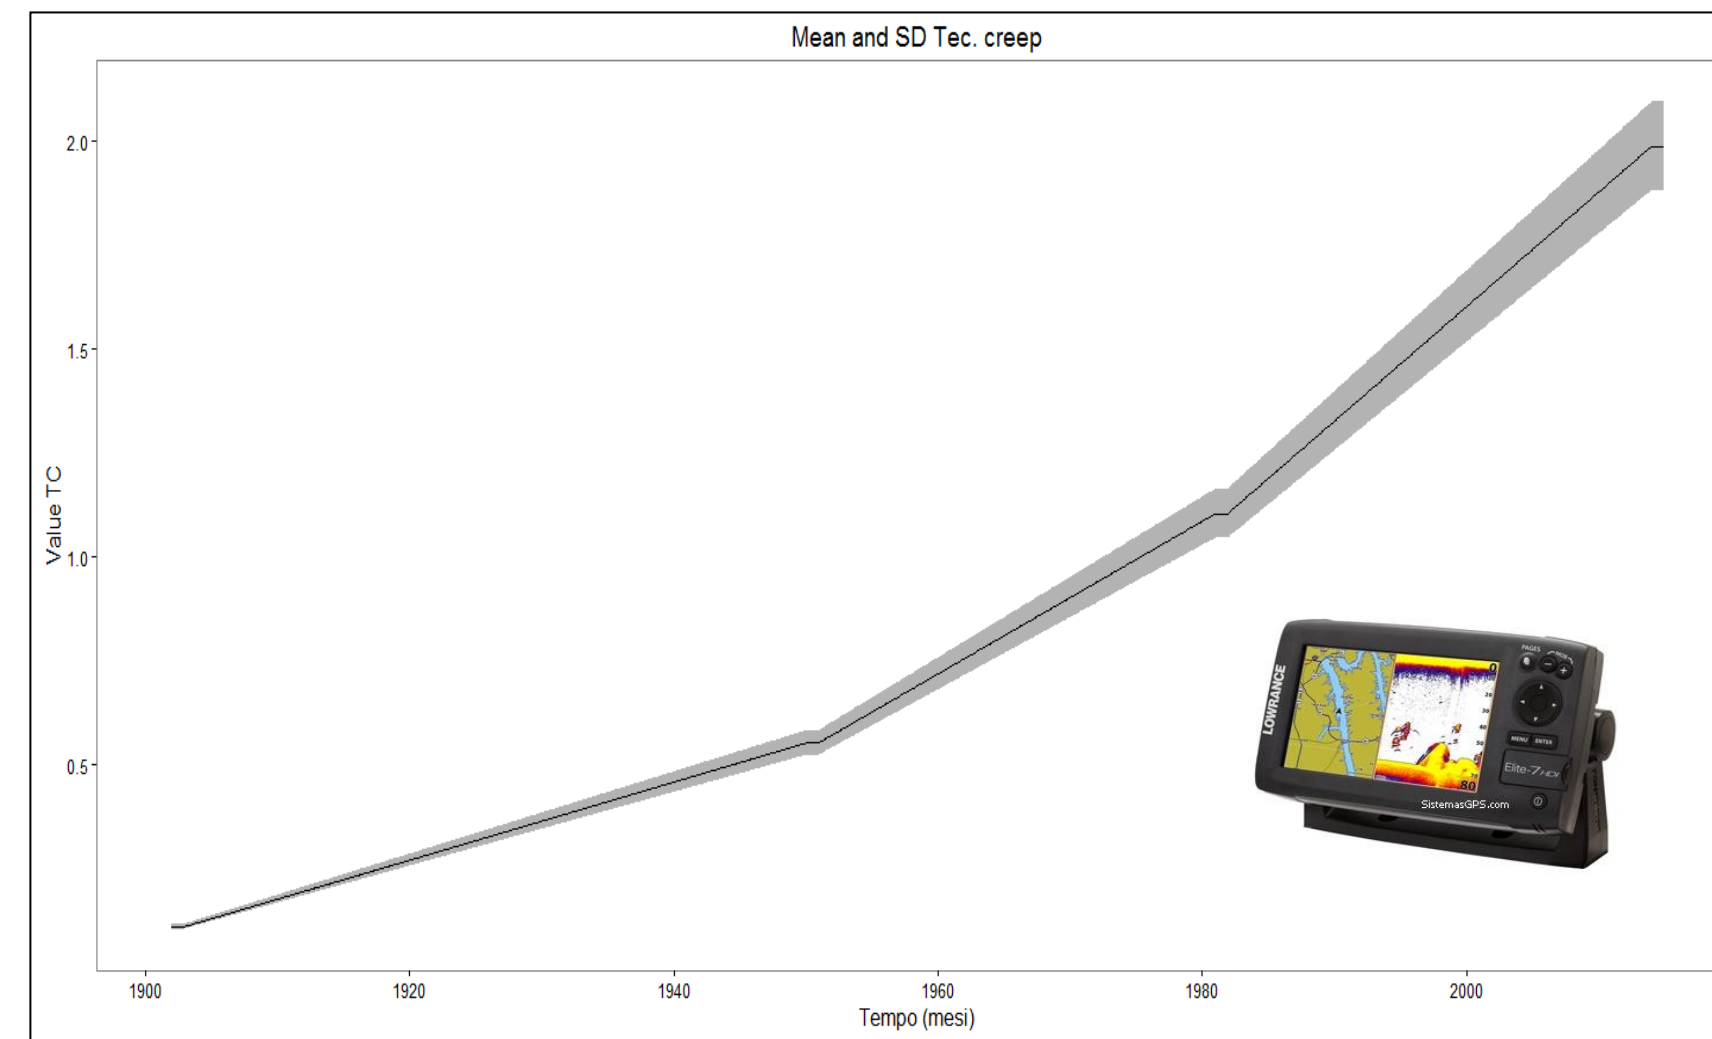

Panzeri et al., 2016

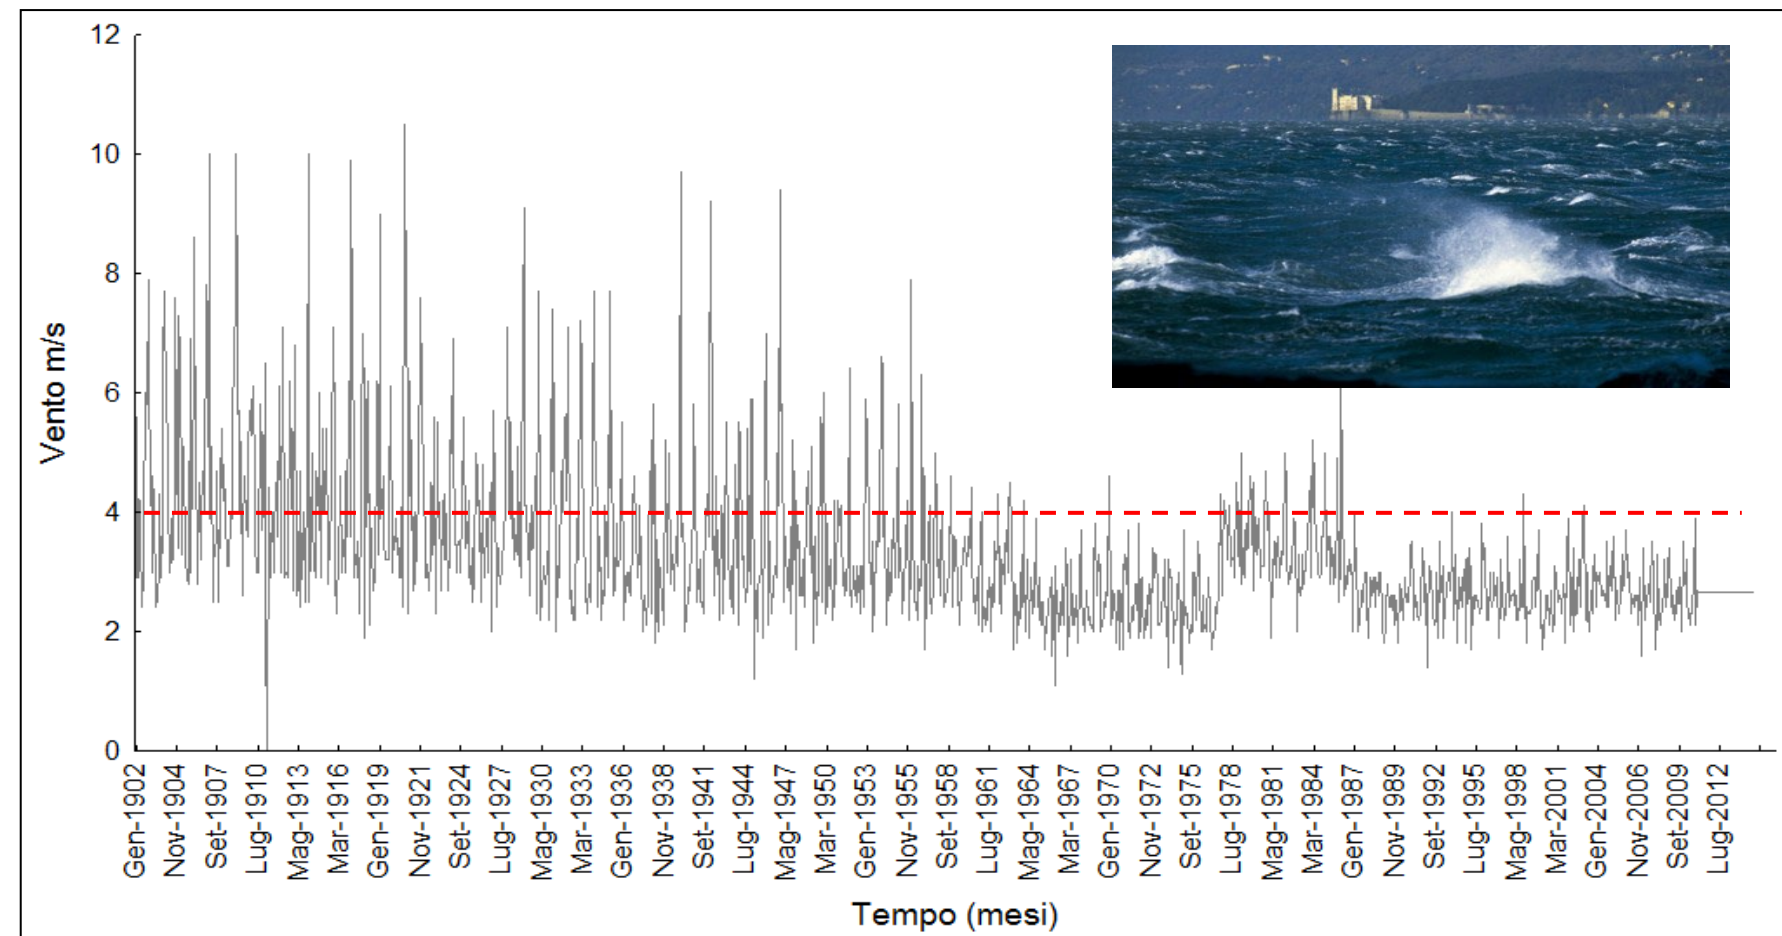

Fishing capacity [N lampara]

Estimated technological creep []

Wind speed [m/s]

length [mm] classes in catches [%]

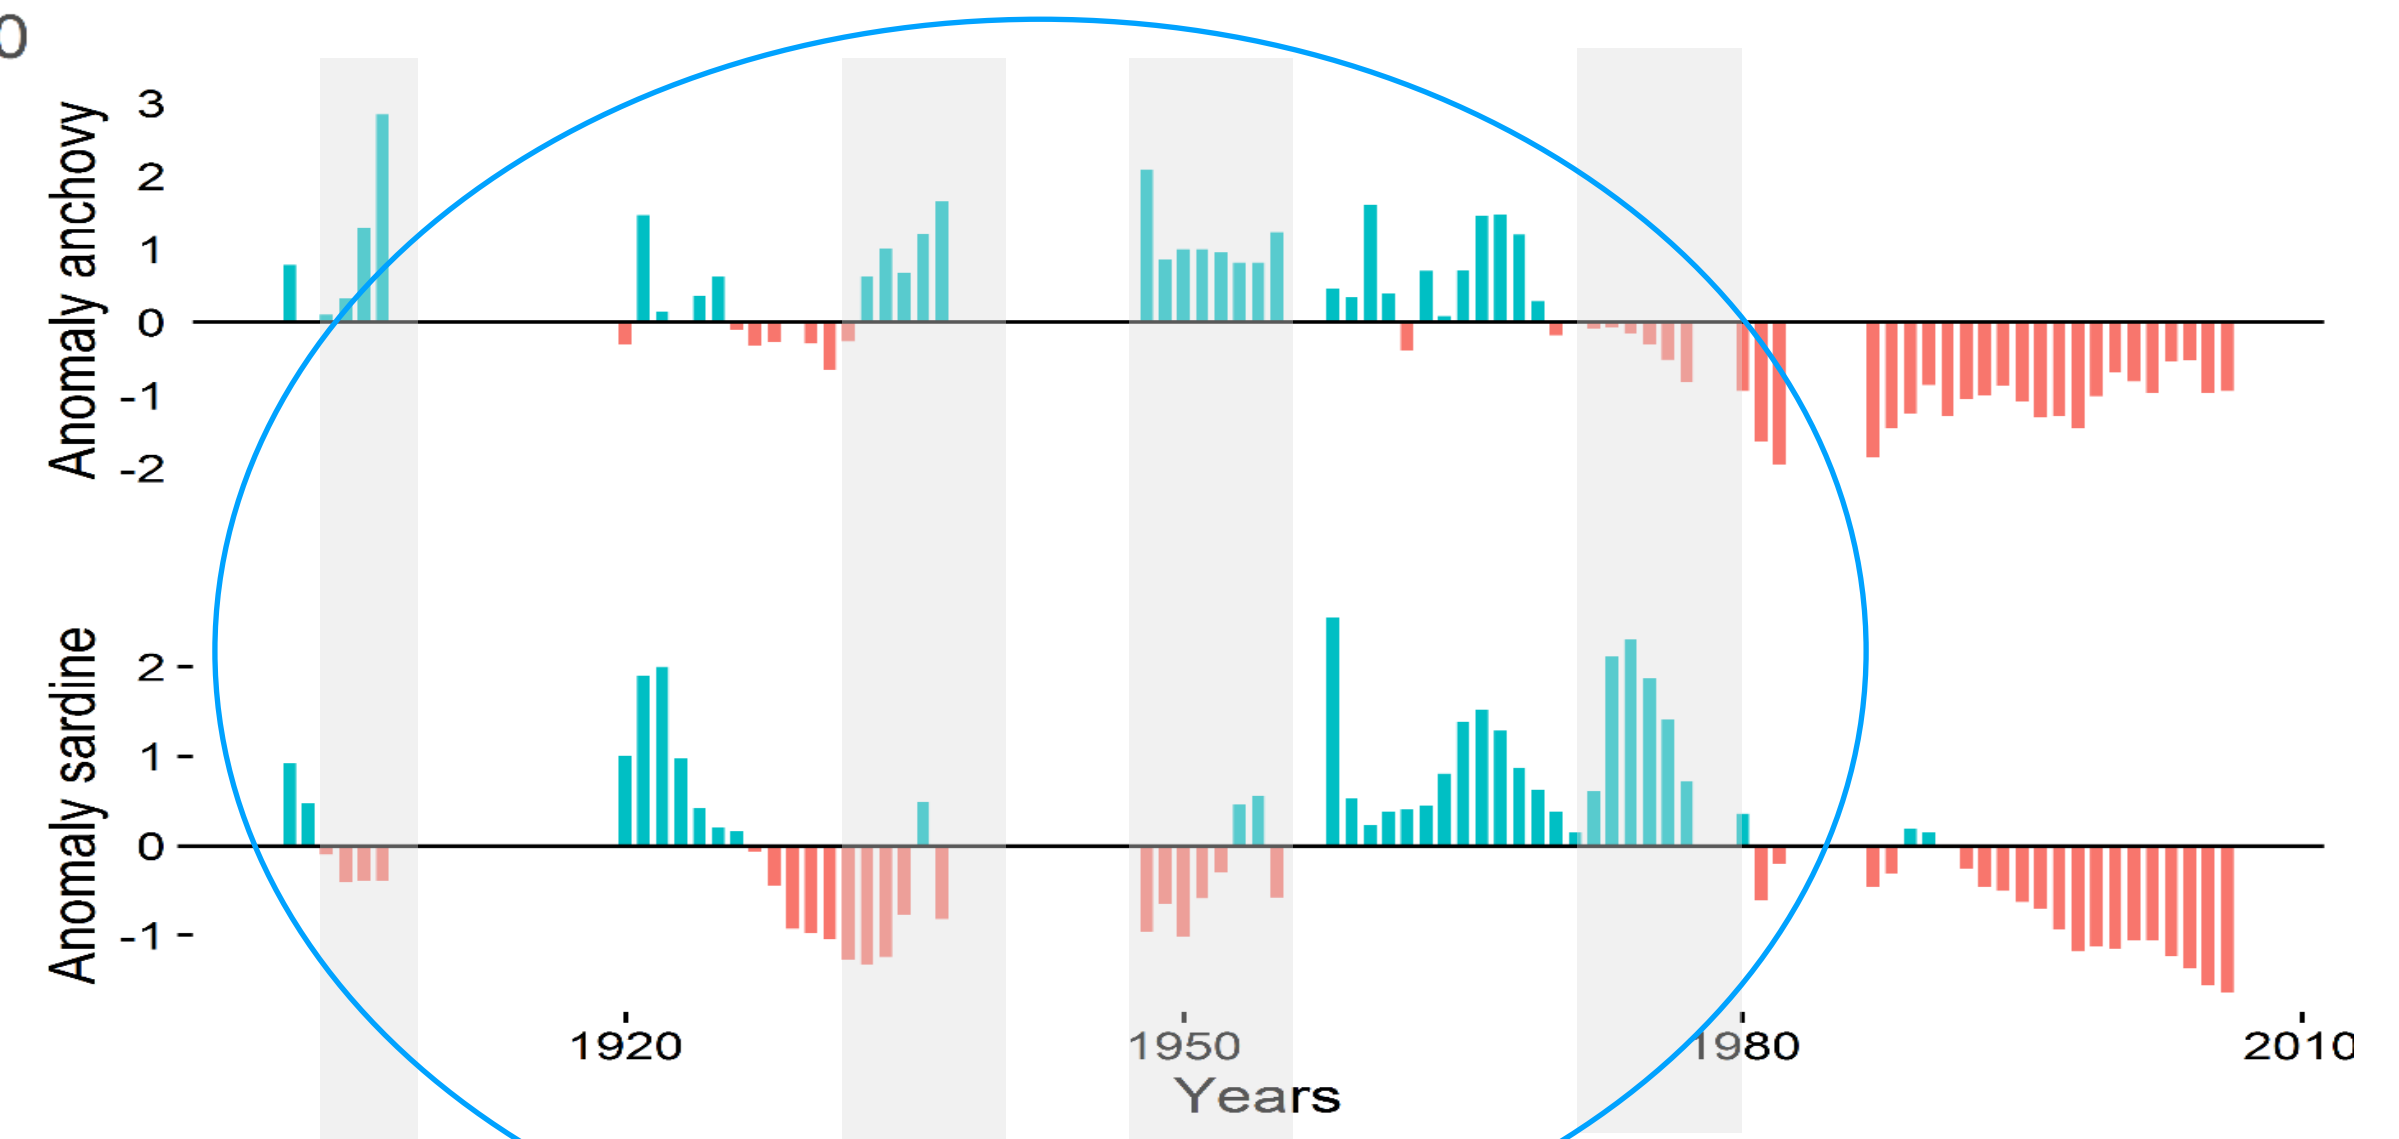

Panzeri et al., 2016

100 years reconstructions small pelagics in Adriatic

In spite of the very low contribution of the Gulf of Trieste on the overall catches of sardine and anchovy (approx. >1% of the Adriatic catches), the traditional fishing activity (basically not expanding fishing area) represent a **reliable and standardizeable sampling by accounting for other changes quantifiable through time: capacity; tech creep; wind; sizes....**

These long terms fluctuations might be induced by several factors. But note that last years the situation is quite negative (break-out of the cyclicality)

Panzeri et al., in prep

Dynamics depending on hydrographic conditions

“since these species **prefer somewhat different hydrographic conditions**, it is possible that suitable conditions for one of them means that conditions are not favourable for the other. Different responses to salinity are confirmed from the opposite sign of the correlation coefficients between the fish data (sardine and mackerel) and salinity.”

	NAO index	Pressure differences	Salinity
Sardine	0.05	0.56*	0.43*
Mackerel	-0.08	-0.19	-0.53*
Anchovy	-0.45*	0.04	0.12
Sprat	-0.52*	0.03	0.34*

“The positive pressure difference implies higher pressure over the mid Atlantic and lower pressure over the southeast Mediterranean. Such a pressure distribution is favourable for LIW formation in the eastern Mediterranean, intensified inflow of more saline LIW into the Adriatic and dense water formation in the northern Adriatic. [...] Years with positive pressure differences, which are years of higher salinity, are also more productive years, considering the phytoplankton productivity.»

Grbec et al., 2003

Environmental variables influencing distribution for anchovy larvae

*The results indicate that **the mean depth, surface temperature and salinity gradients** are the most important predictors in the anchovy model. This means that anchovy catches increase according to these three parameters, more specifically at temperatures below 11 °C and between 14 and 22 °C, depths between 20 and 50 m and with a positive increase in the salinity gradient. Surface temperatures higher than 22 °C seem to reduce the catches of anchovy and high salinity gradients*

Carpi et al., 2015

Spawning area and season (sardine)

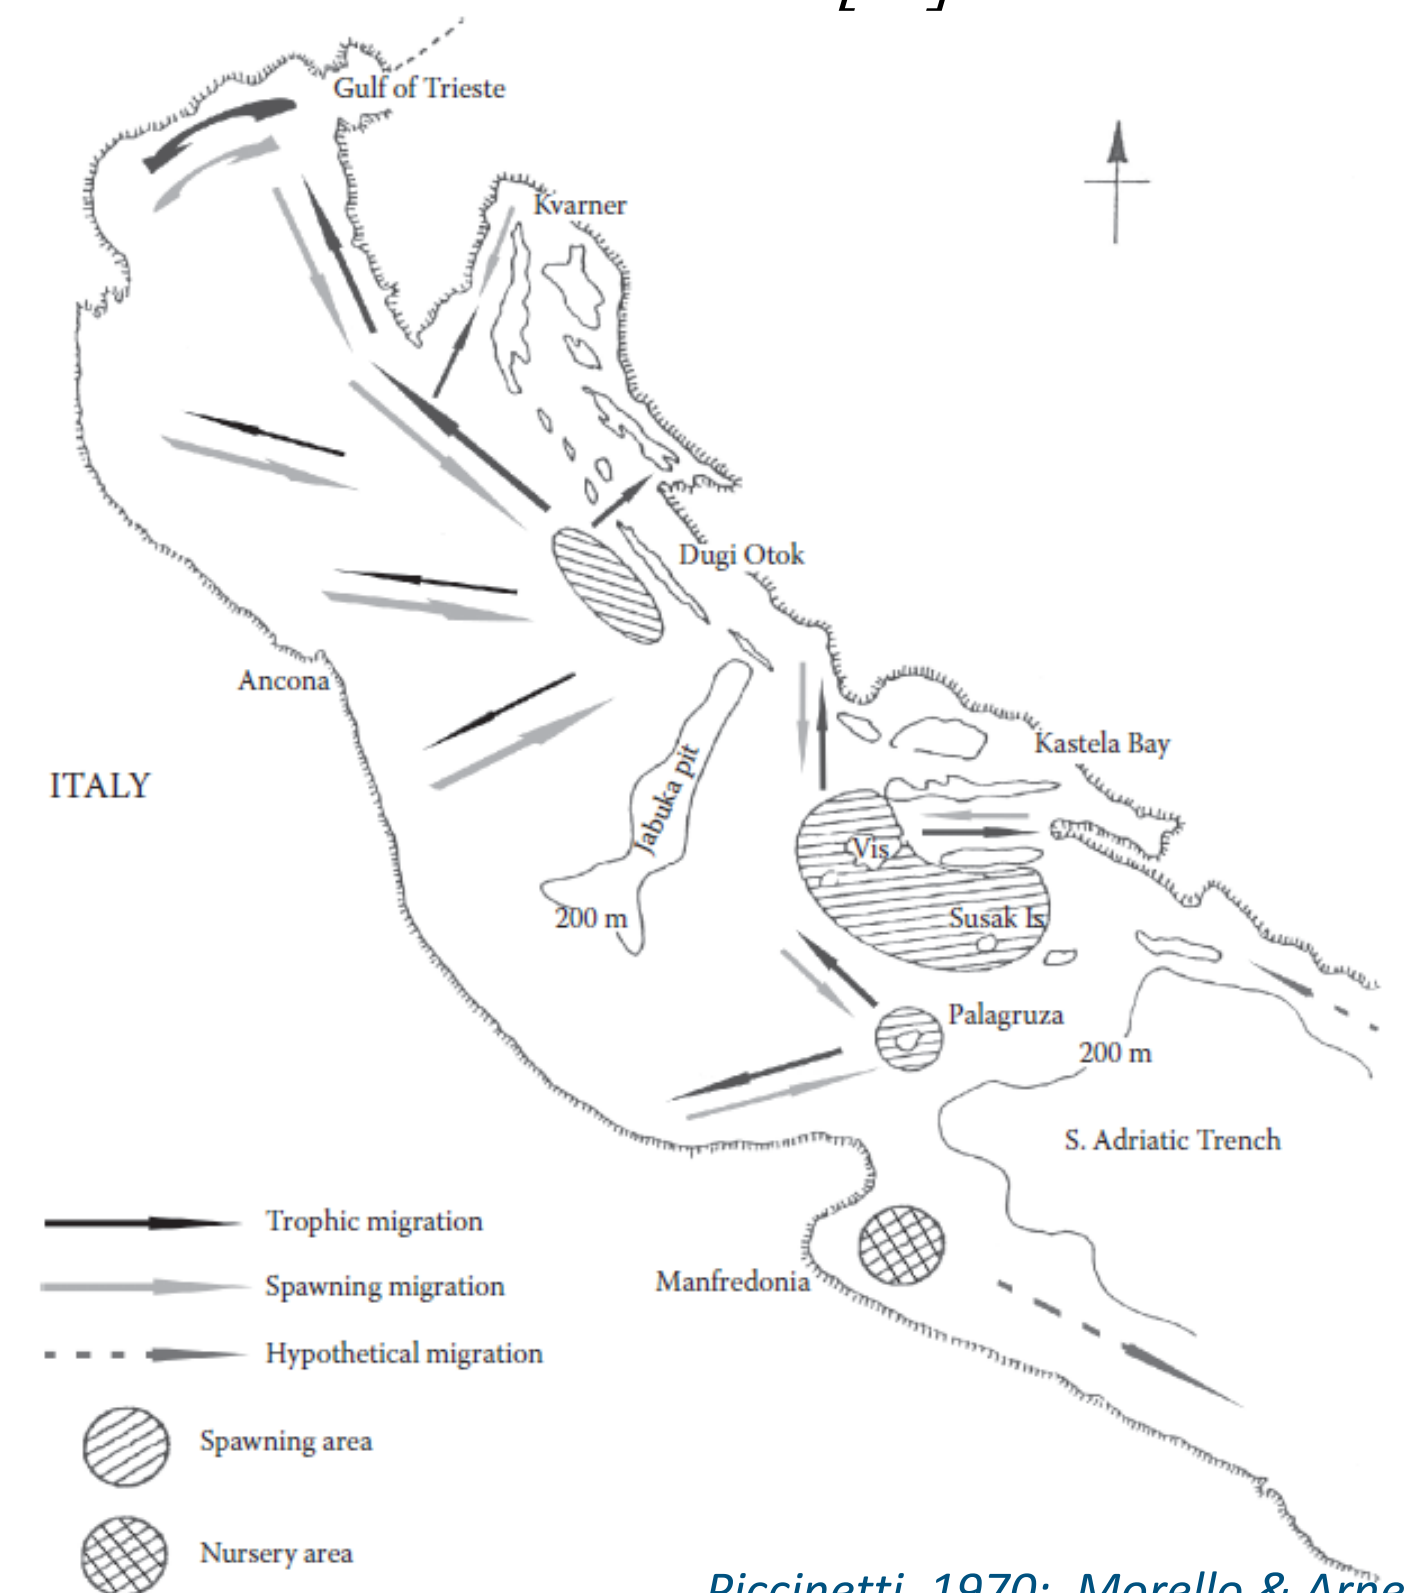

Species	Area	Spawning season	Spawning peak	Temperature range (temperatures at peak spawning) (°C)	Salinity (psu)	Reference
Sardine	Split	Oct–May	Jan–Feb	10.2–20.2 (10.2–12.4)	35.2–37.0	Gamulin 1940
	Central Adriatic	Winter				Mužinić 1954
	Northern and central Adriatic	Oct–May				Gamulin & Karlovac 1956
	Central Adriatic	Oct–Apr	Dec–Feb	(13–16)	37–38	Gamulin & Karlovac 1957
	Vlora bay, Seman-Viase bay, Sazan Island (Albania)	Nov–Feb	Dec & Feb	12–20	37.5–38.5	Rakaj 1962
	Central Adriatic	Nov–Apr		11.9–19.4	37.1–38.8	Karlovac 1969a
	Central Adriatic	Oct–May	Mar	13.1–18.0	38–38.5	Karlovac 1969b
	Central Adriatic	Sept–May				Vučetić 1971
	Central Adriatic	Oct–April	Jan			Vučetić 1975
	Kvarner, Susak and Dugi Otok	Nov–June	Nov & Apr	11.6–11.7	38.1–38.2	Teskeredžić 1978
	Northern and central Adriatic (Trieste-Gargano)			8.4–14.7 (12.1–13.9)	37.6–38.8	Regner et al. 1987
	Southern Adriatic (Gargano-Otranto)	Oct–May	Oct & Dec			Casavola et al. 1998
	Northern and central Adriatic (Trieste-Gargano)			9–15 (11–15)		Regner et al. 1988
	Albania (2003)	Sept–Apr				Kolitari 2006
	Albania (2004)	Oct–Apr				Kolitari 2006
	Albania (2005)	Oct–Apr				Kolitari 2006

Spawning, in the Adriatic Sea, has been reported to **take place between 9 and 20°C at salinities ranging from 35.2 to 38.8 psu**[...] at depths between 30 and 150 m although more typically between 60 and 120 m

spawning takes place mainly in winter, generally between October and May

[...] two main spawning grounds in the Adriatic Sea: the northern Adriatic off the Dugi Otok Island and the southern Adriatic around the exterior of the mid-Dalmatian Islands and extending offshore to Palagruža. [...] despite food being of major importance for post-larval development and survival, all sardine spawning grounds mentioned are located within the least productive [...] Sardine spawning areas, located at depths ranging from 10 to 20 m, coincided with the boundaries of these frontal zones produced by the upwelling and in both cases [...]

Piccinetti, 1970; Morello & Arneri, 2009

Spawning area and season (anchovy)

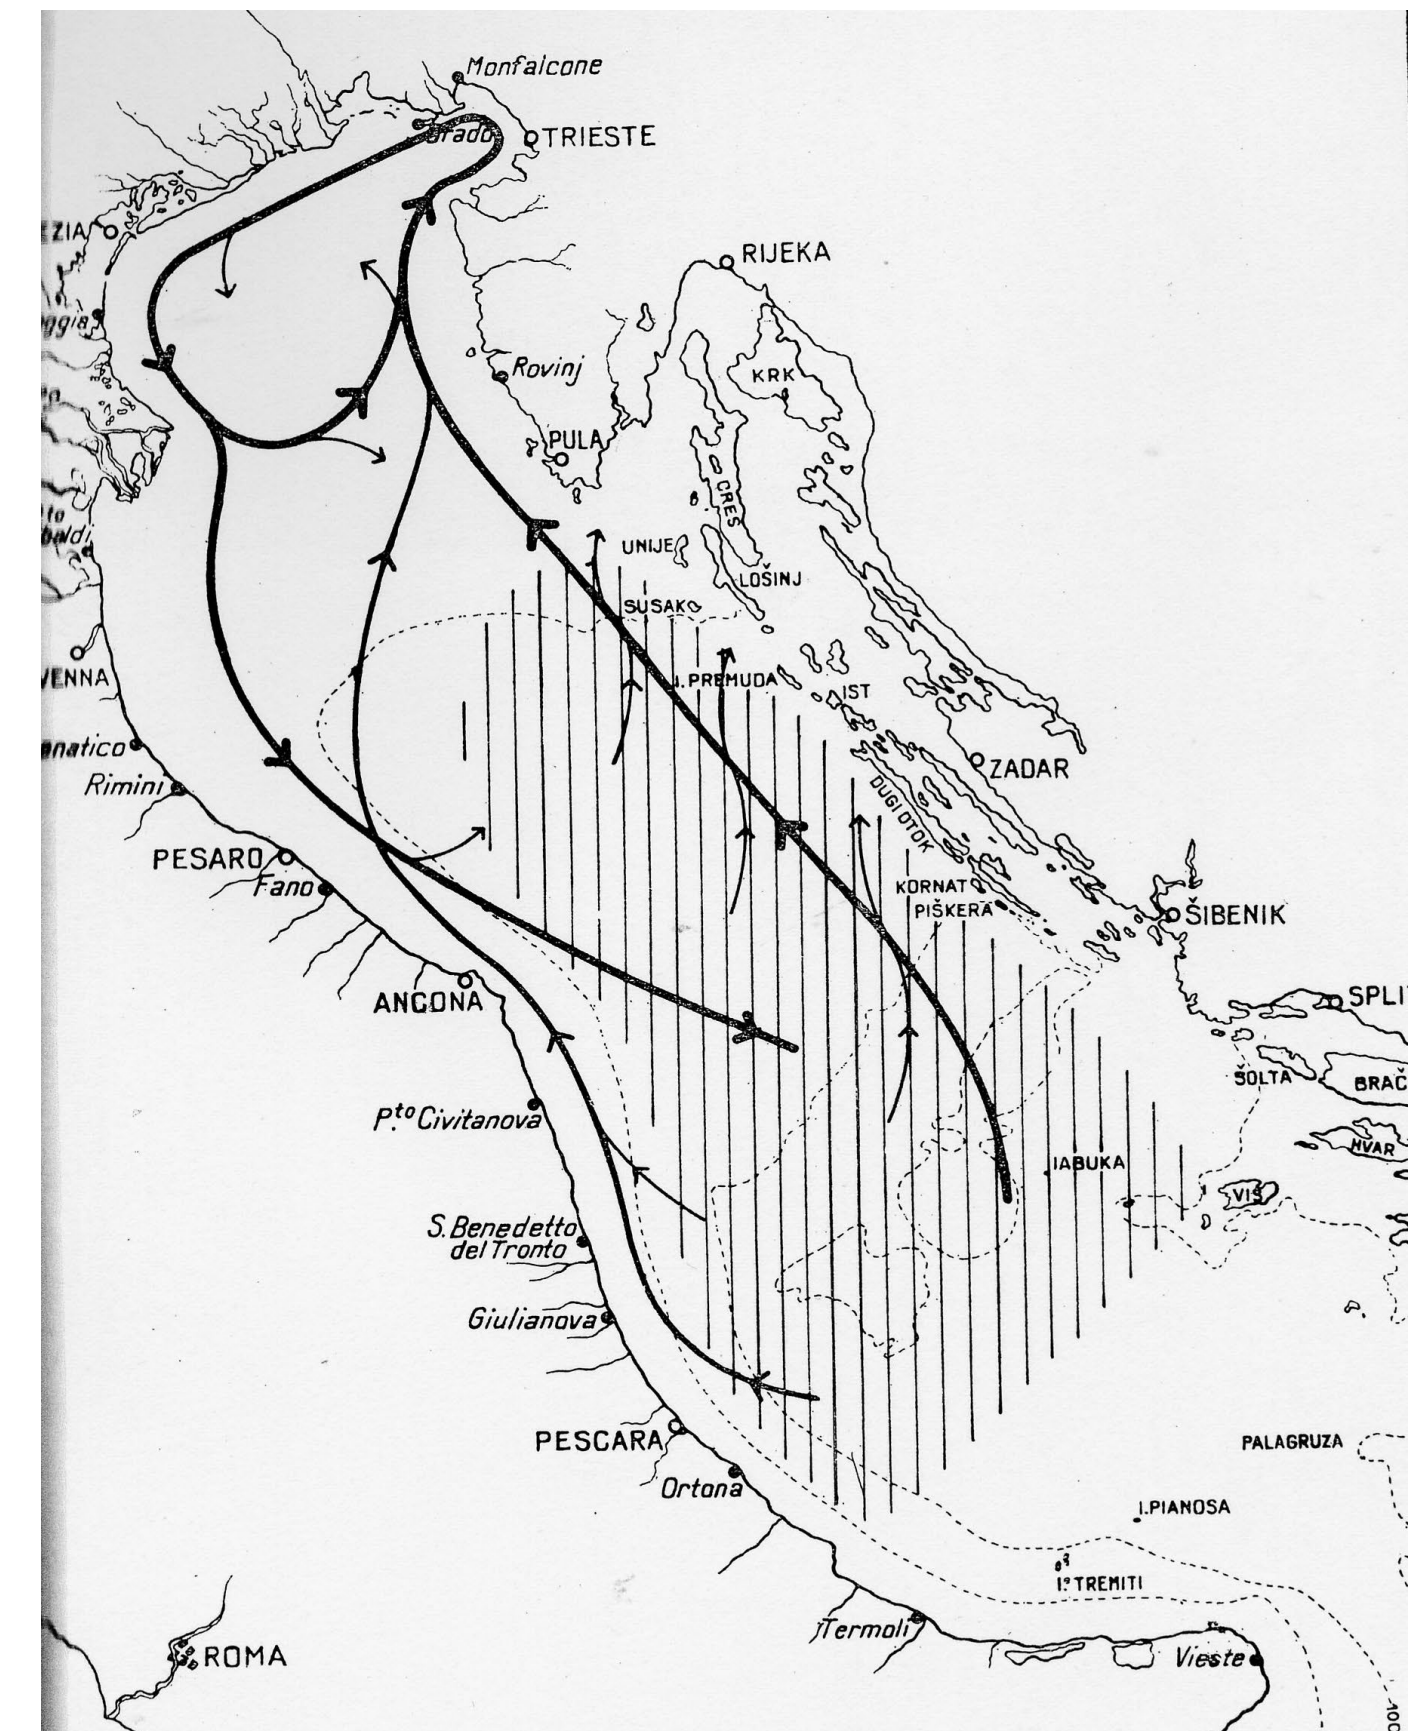

Species	Area	Spawning season	Spawning peak	Temperature range (temperatures at peak spawning) (°C)	Salinity (psu)	Reference

Albania (2005)	May–Oct				Kolitari 2006	

In contrast to sardine, anchovy spawning takes place in the warmer months, generally between April and October

Migration routes of anchovy in the Adriatic Sea Dashed area is main the winter resting area Anchovy adults migrate from the deeper overwintering waters to shallower coastal areas for spawning (Sinovčić 2000b) and similar migrations have been reported for the Black Sea (Majarova & Chugunova 1954, Demir 1963).

The presence of anchovy eggs in the Adriatic has been reported at temperatures between 11.6 and 28°C, and at salinities ranging from 9.1 to 38.7 psu (Table 1). Spawning peaks occur at the higher temperatures in the range, between 18 and 28°C (Table 1) whereas egg density is inversely proportional to salinity (Zavodnik 1970).

Changes in Biomass at sea after introduction of *Mnemiopsis*

Catches after introduction of *Mnemiopsis*

Tirelli et al., 2019

Mnemiopsis effects on landings (Chioggia market)?

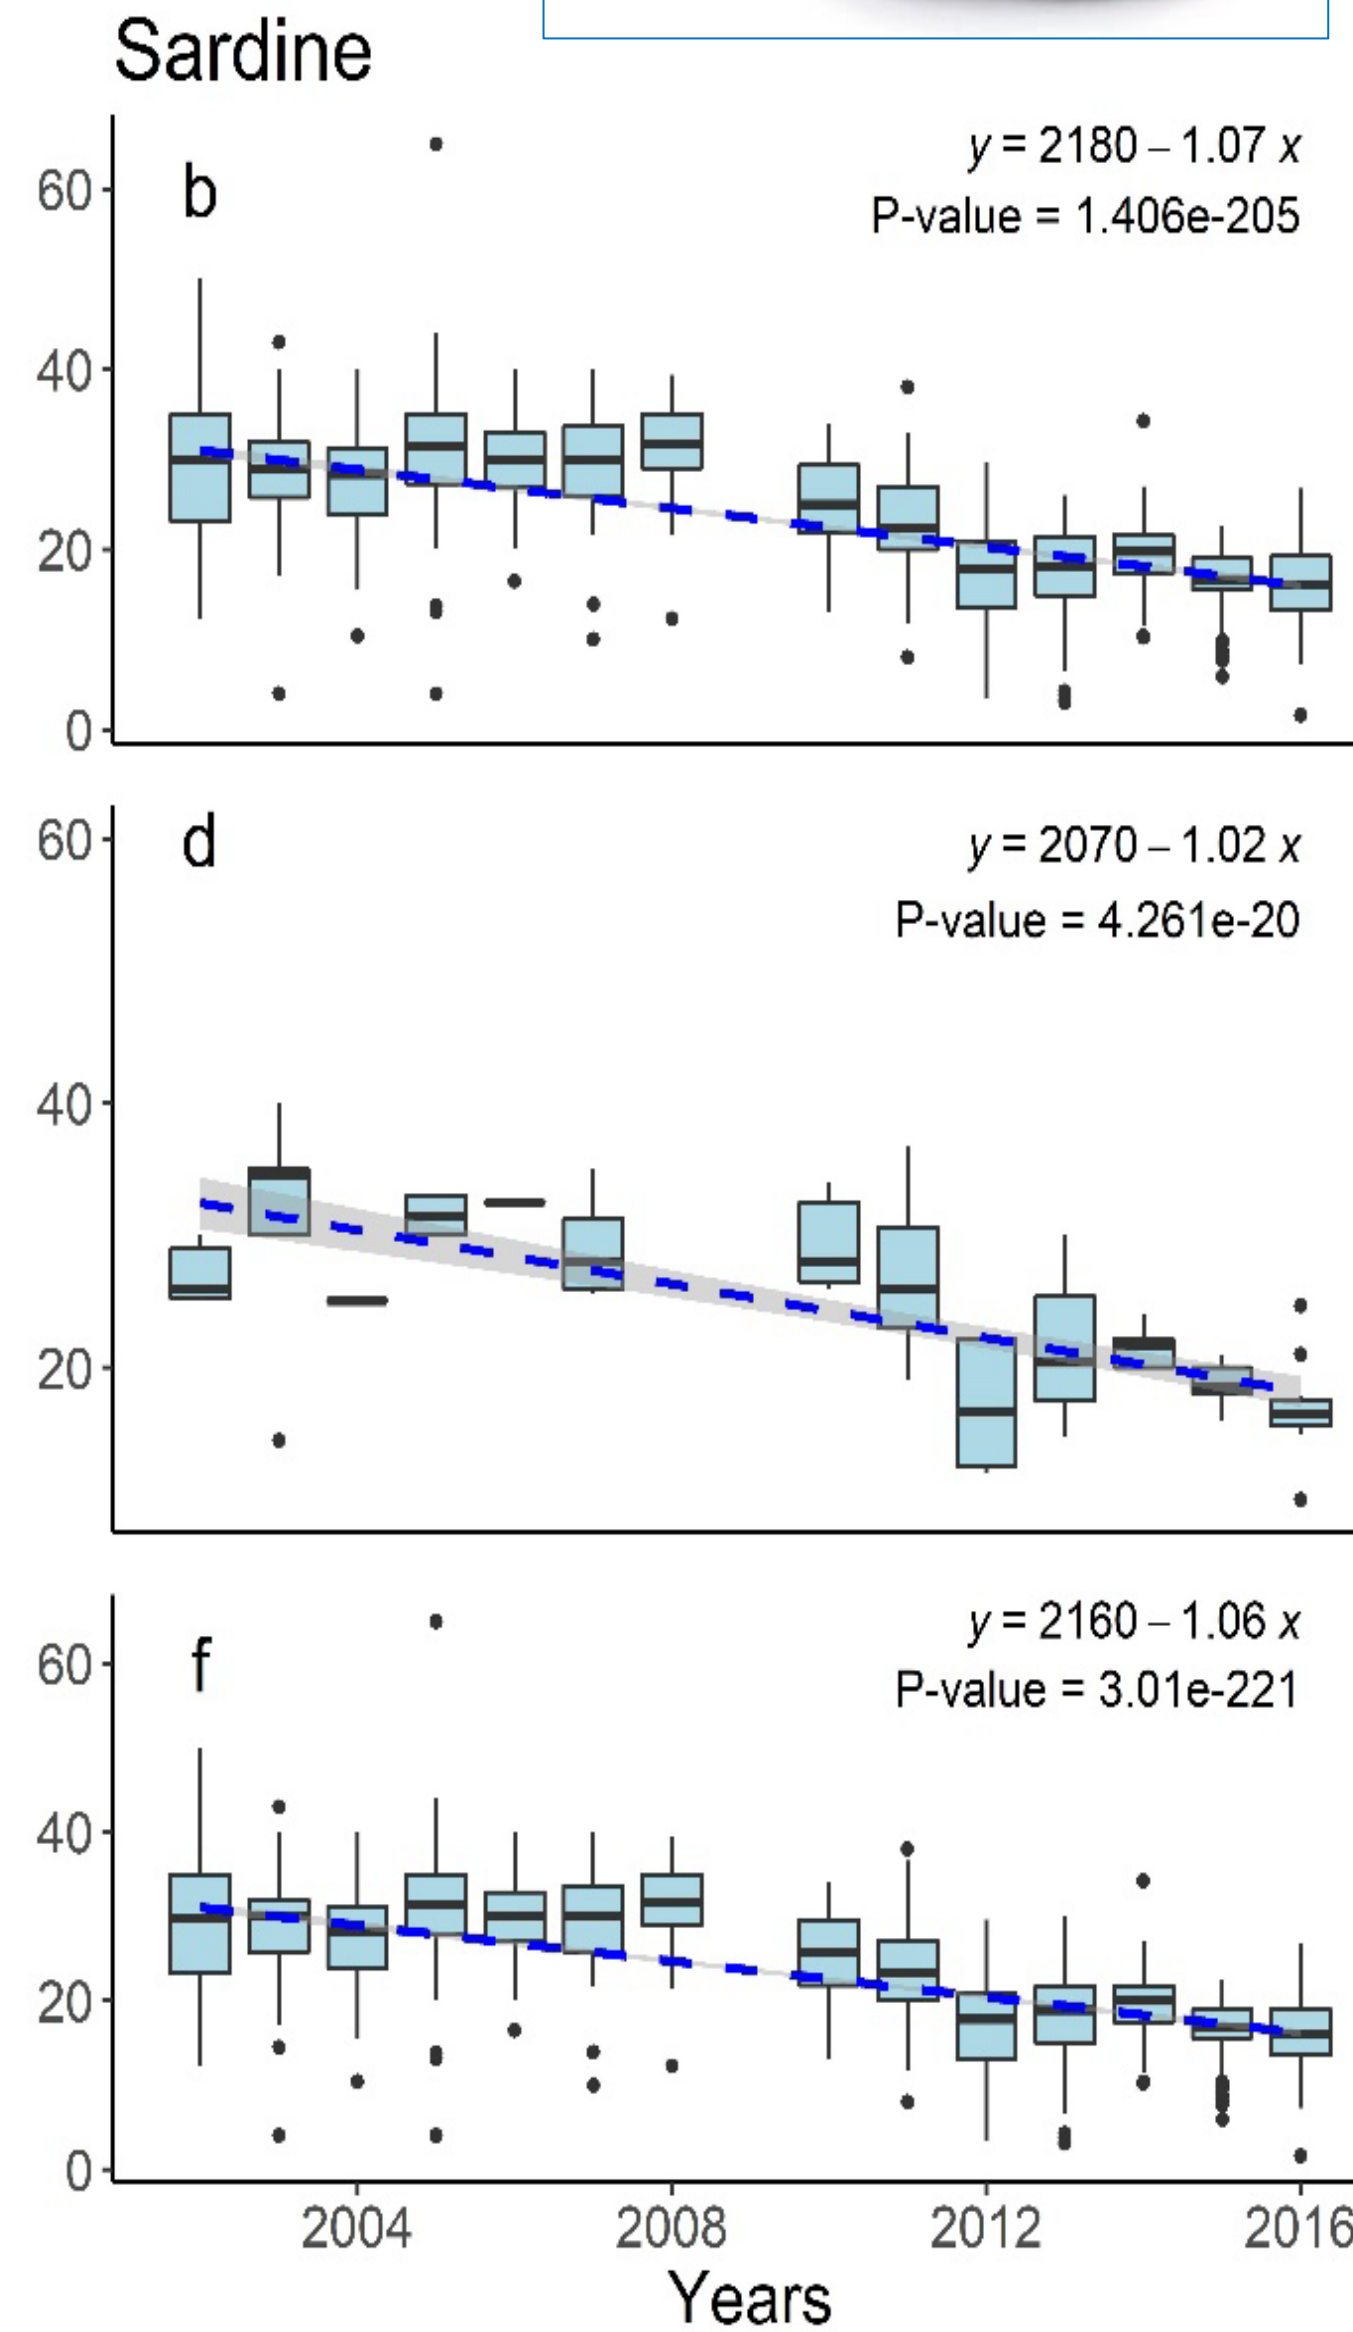

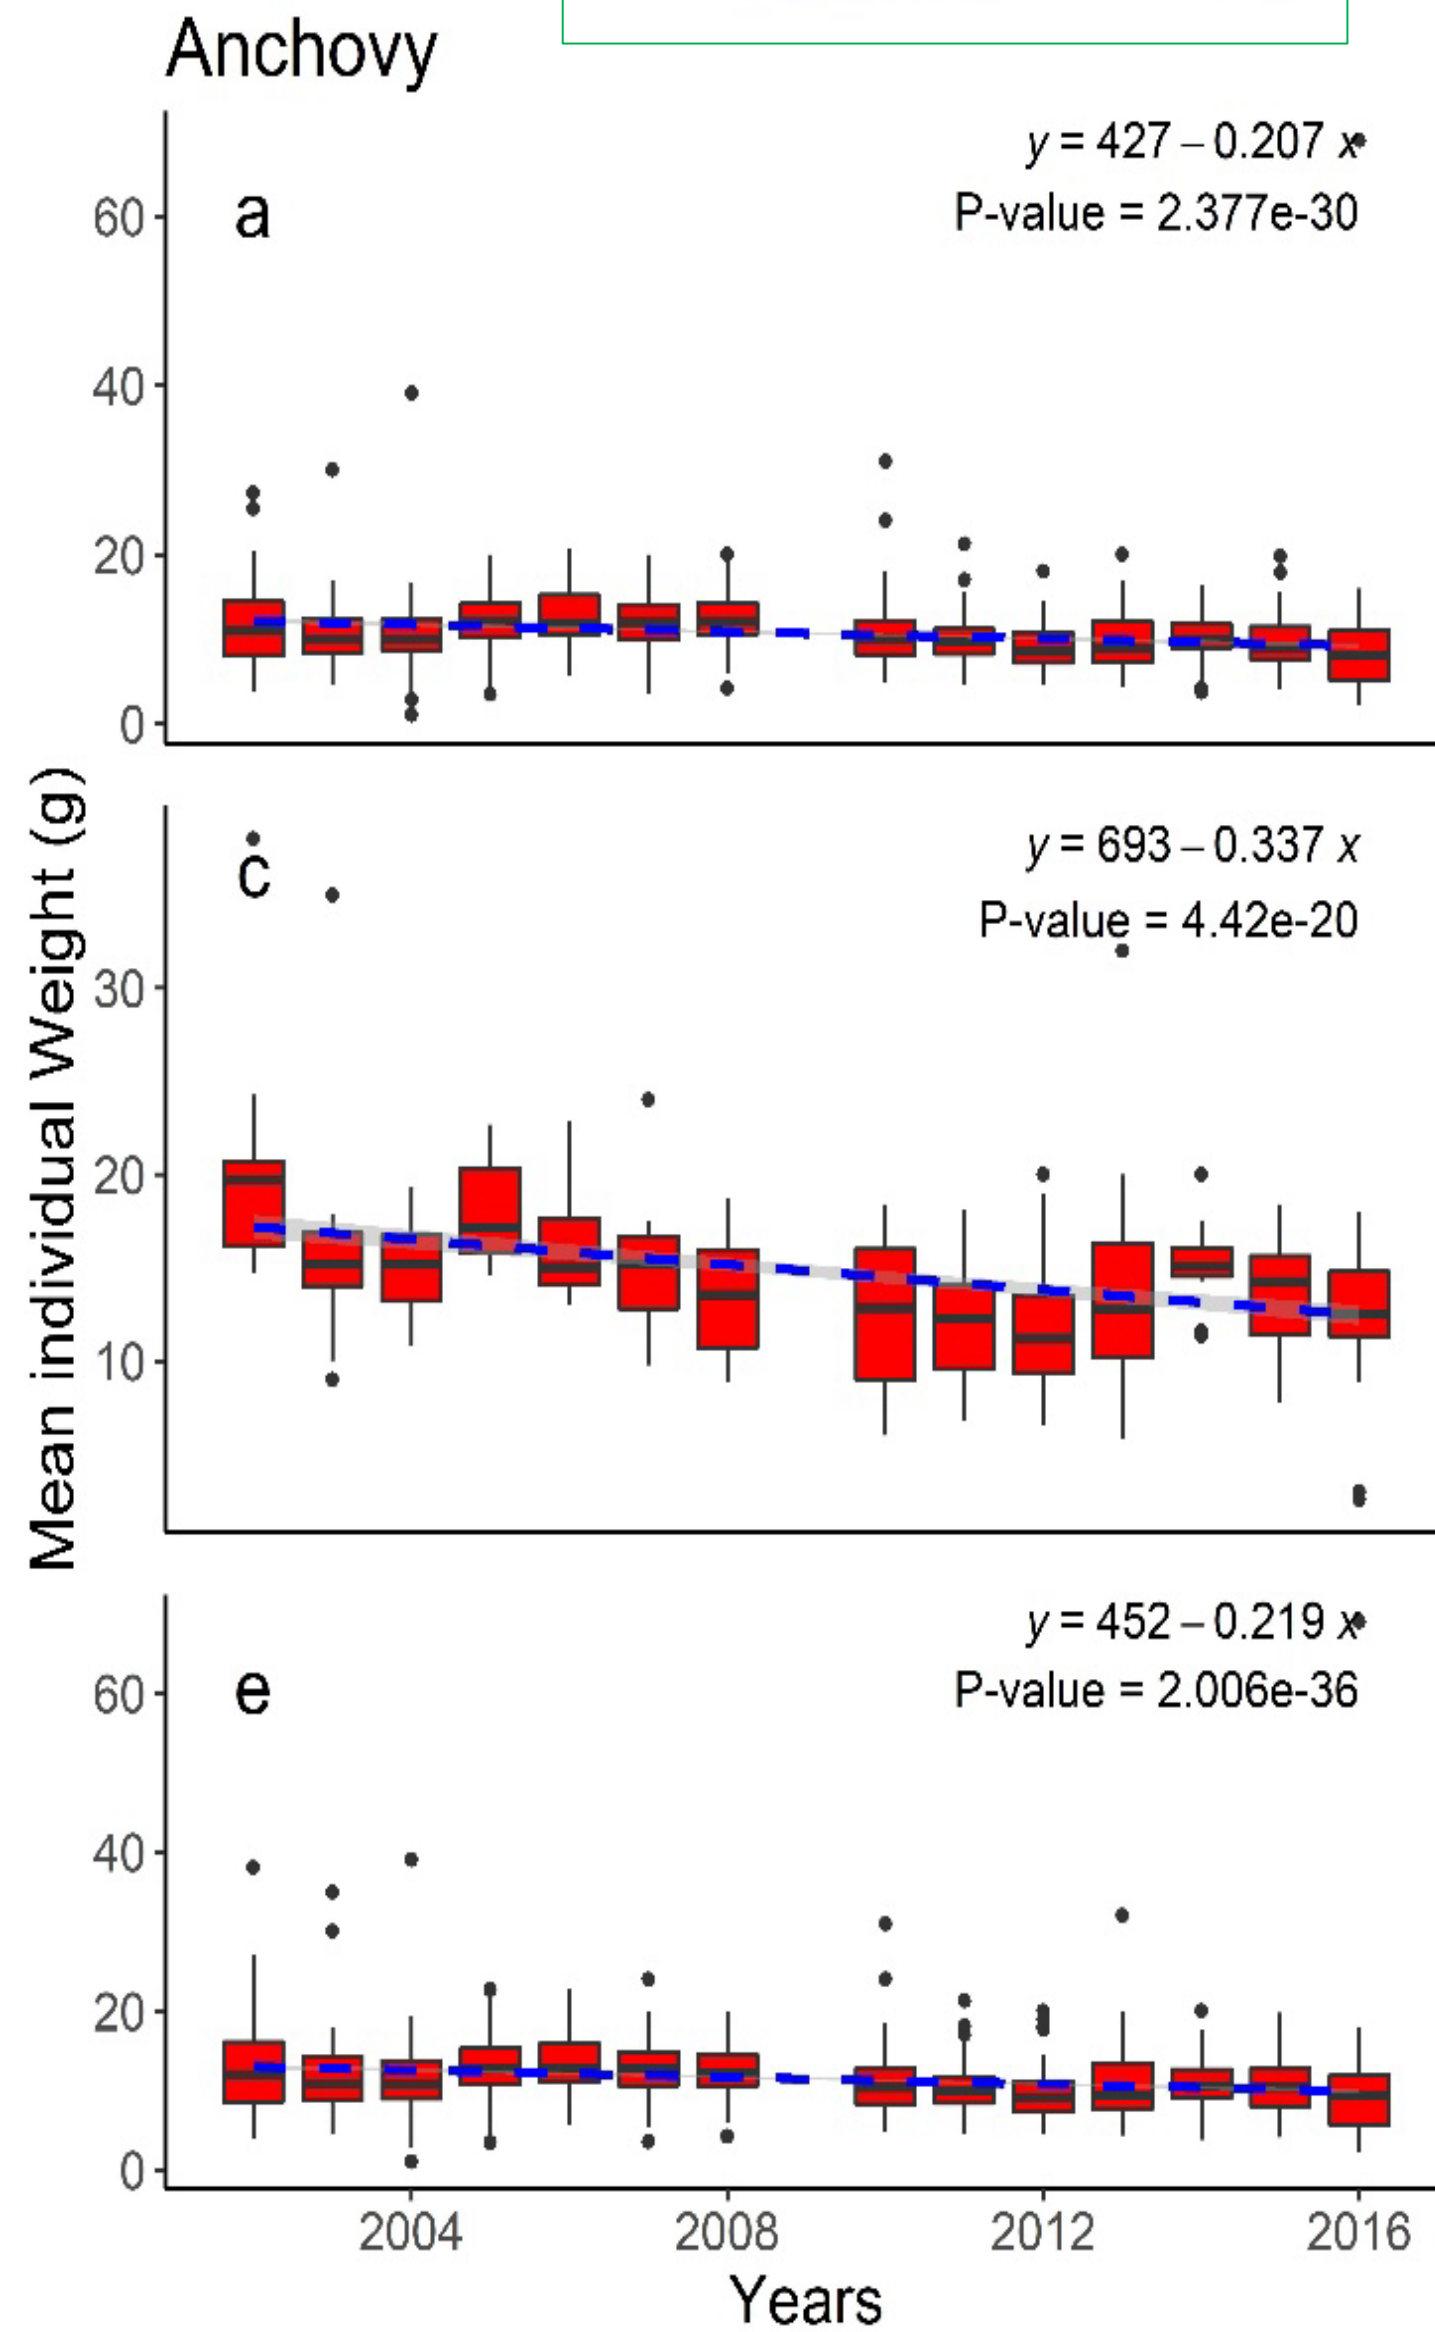

**Stock assessments are primary tools for describing the situation;
are there other easy indicators to tell us the situation?**

Clodia Database: <https://chioggia.biologia.unipd.it/banche-dati/>

Year 2020 data:
Carlotta Mazzoldi (University of Padua)

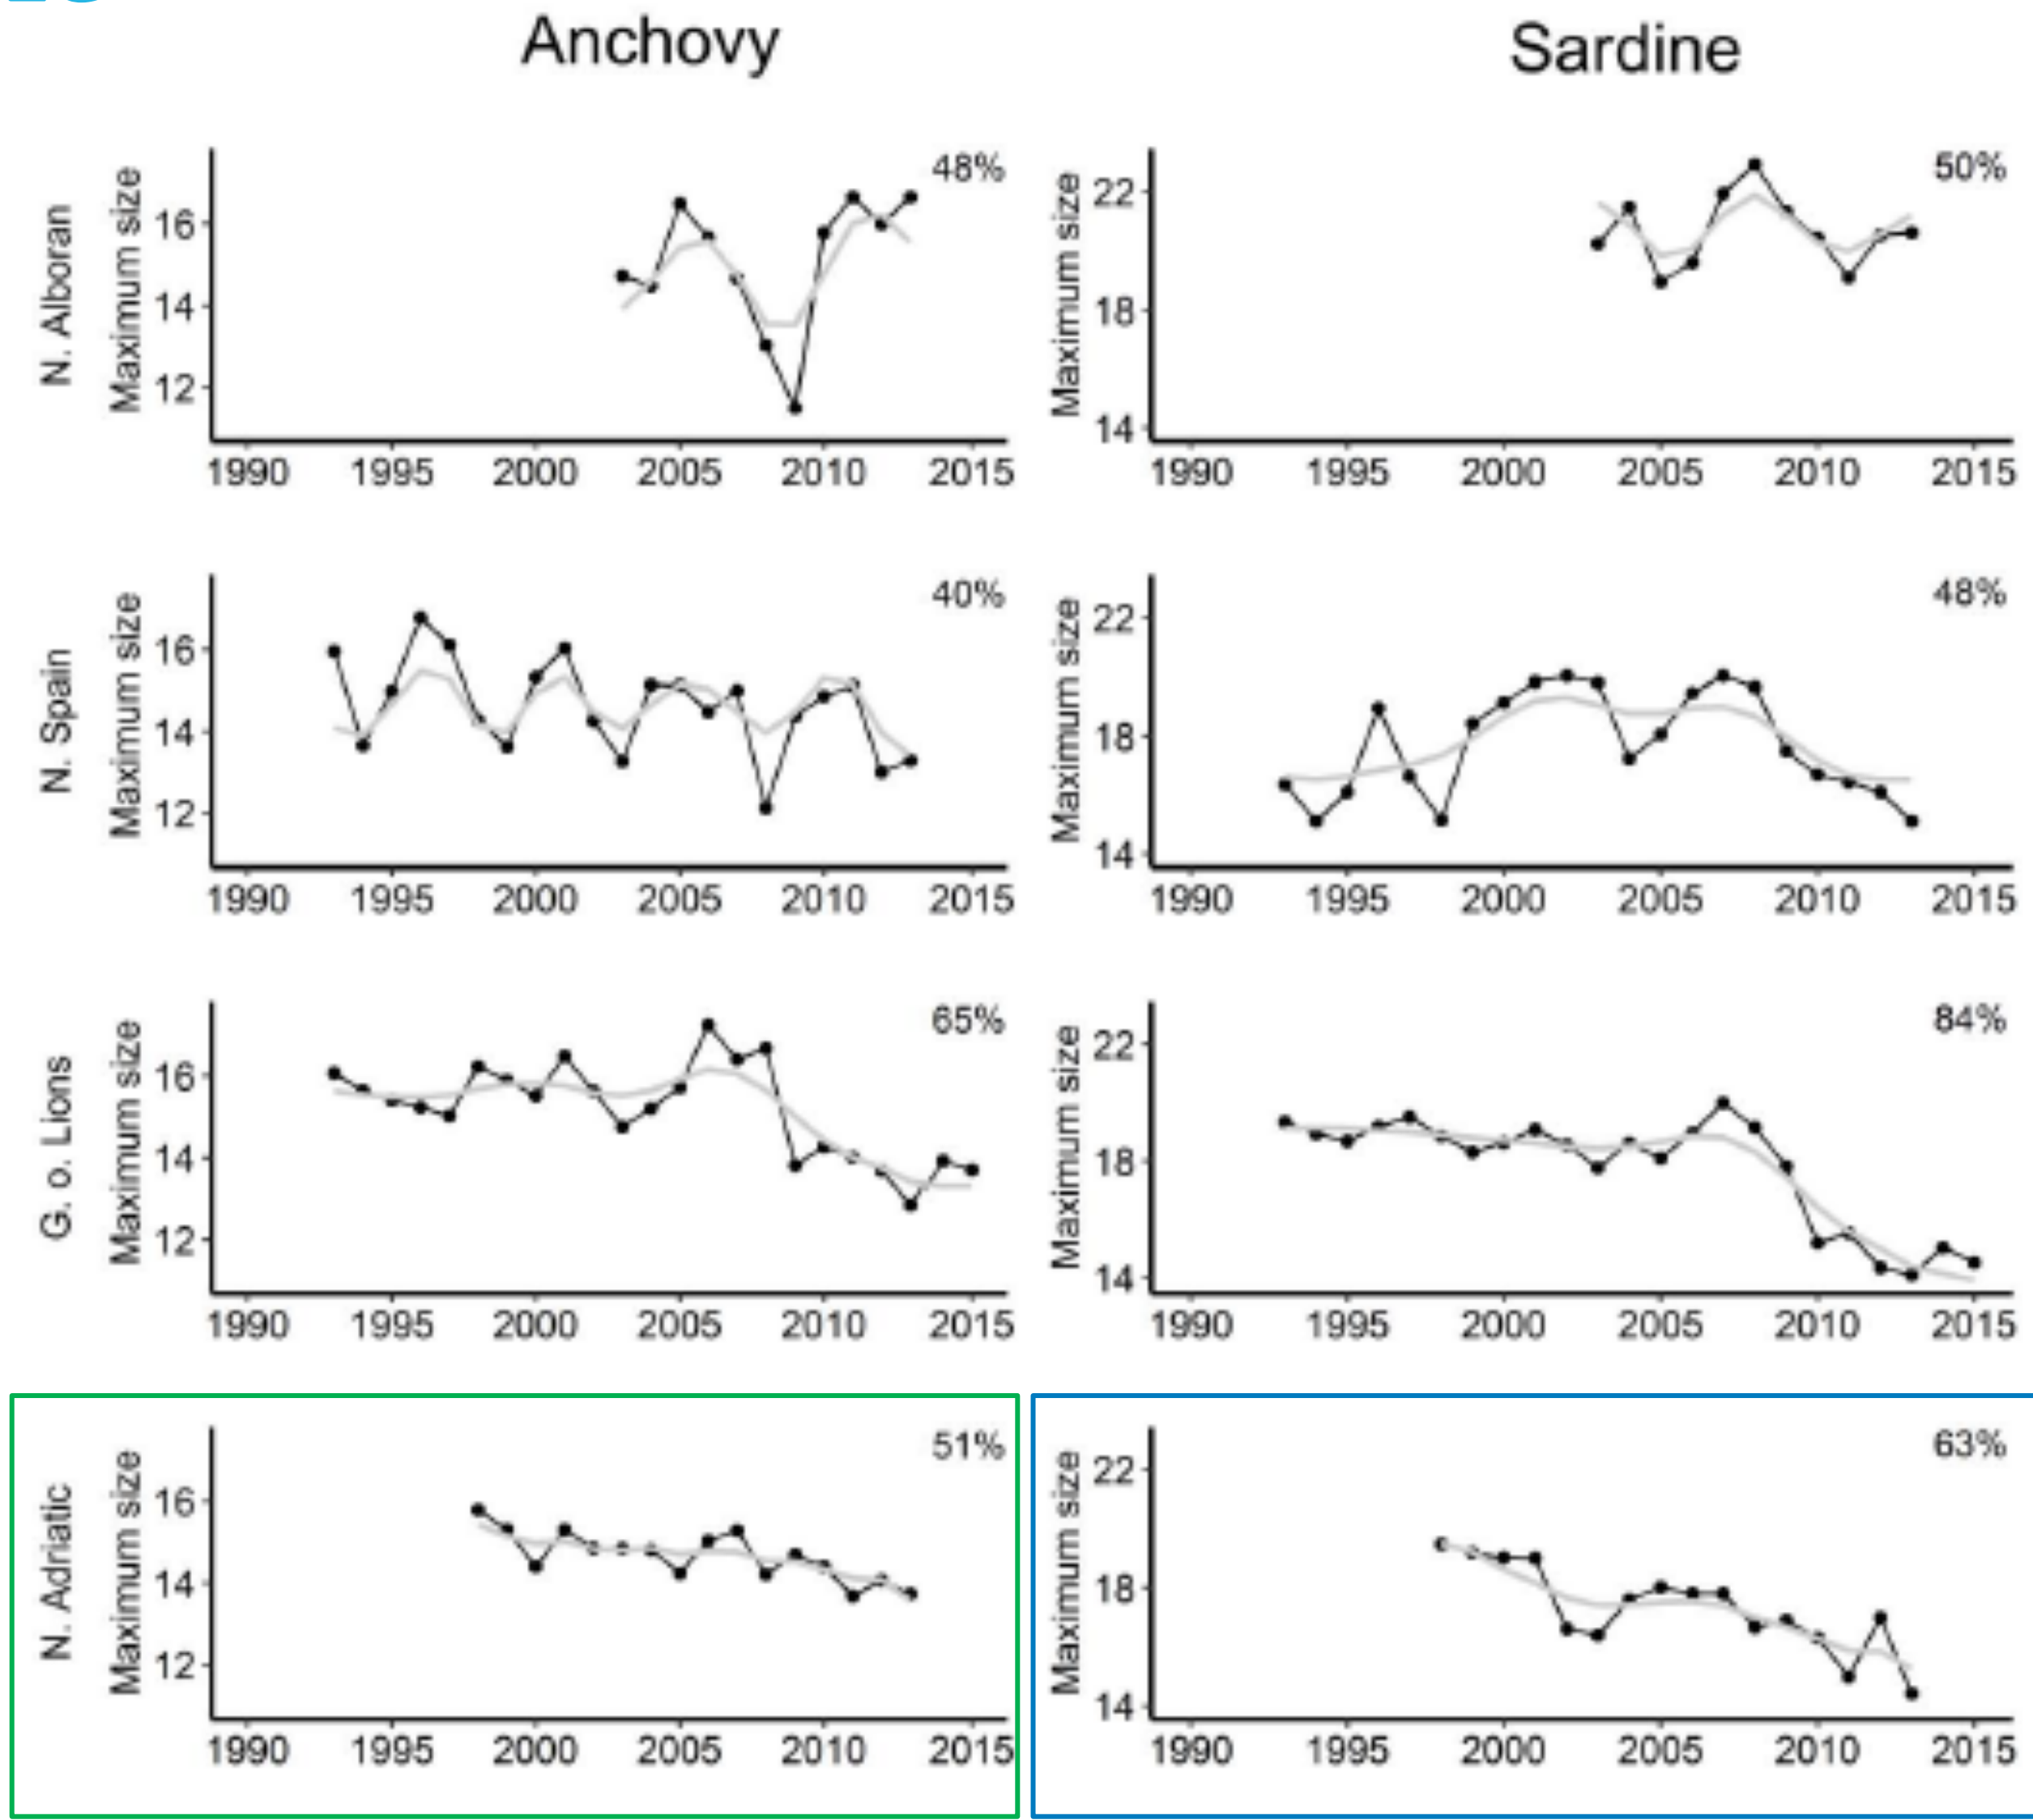

Size of anchovy and sardine in the Adriatic Sea (GSA17)

Fisheries independent trawl survey (MEDITS) data from 2002 to 2016.

Maximum size

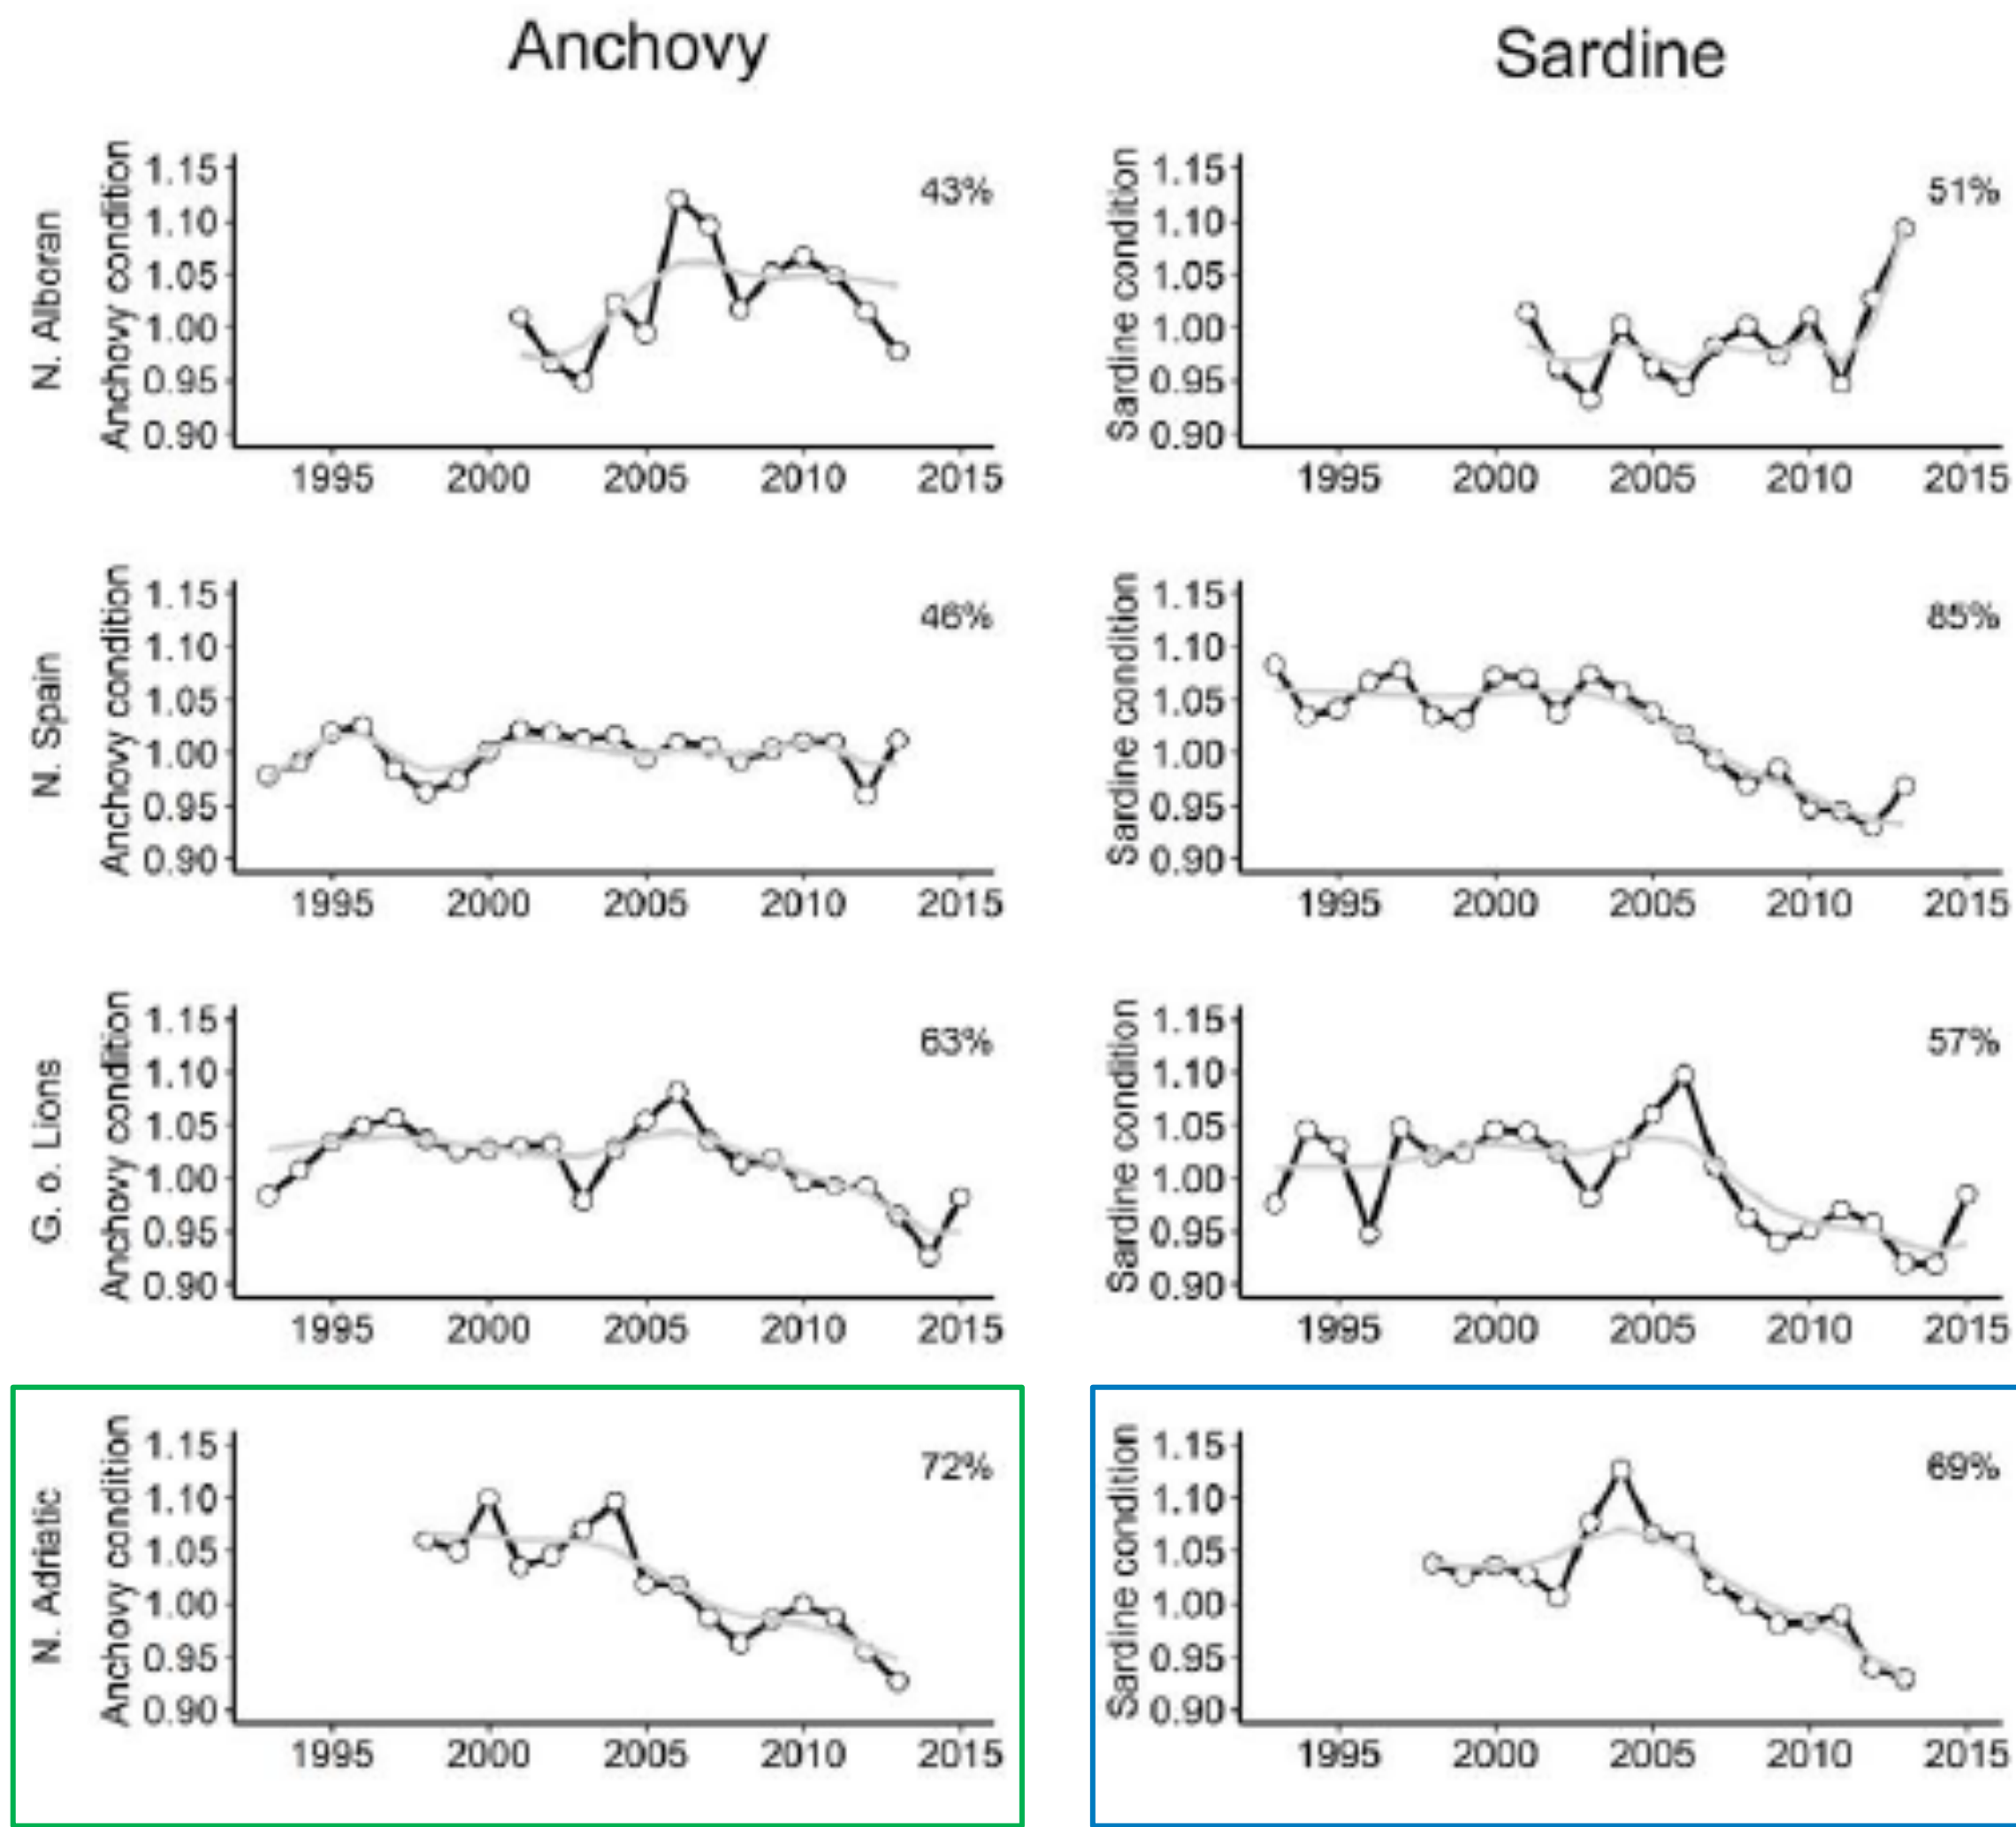

Brosset et al., 2016

A relevant easy signal of difficult times for small pelagics

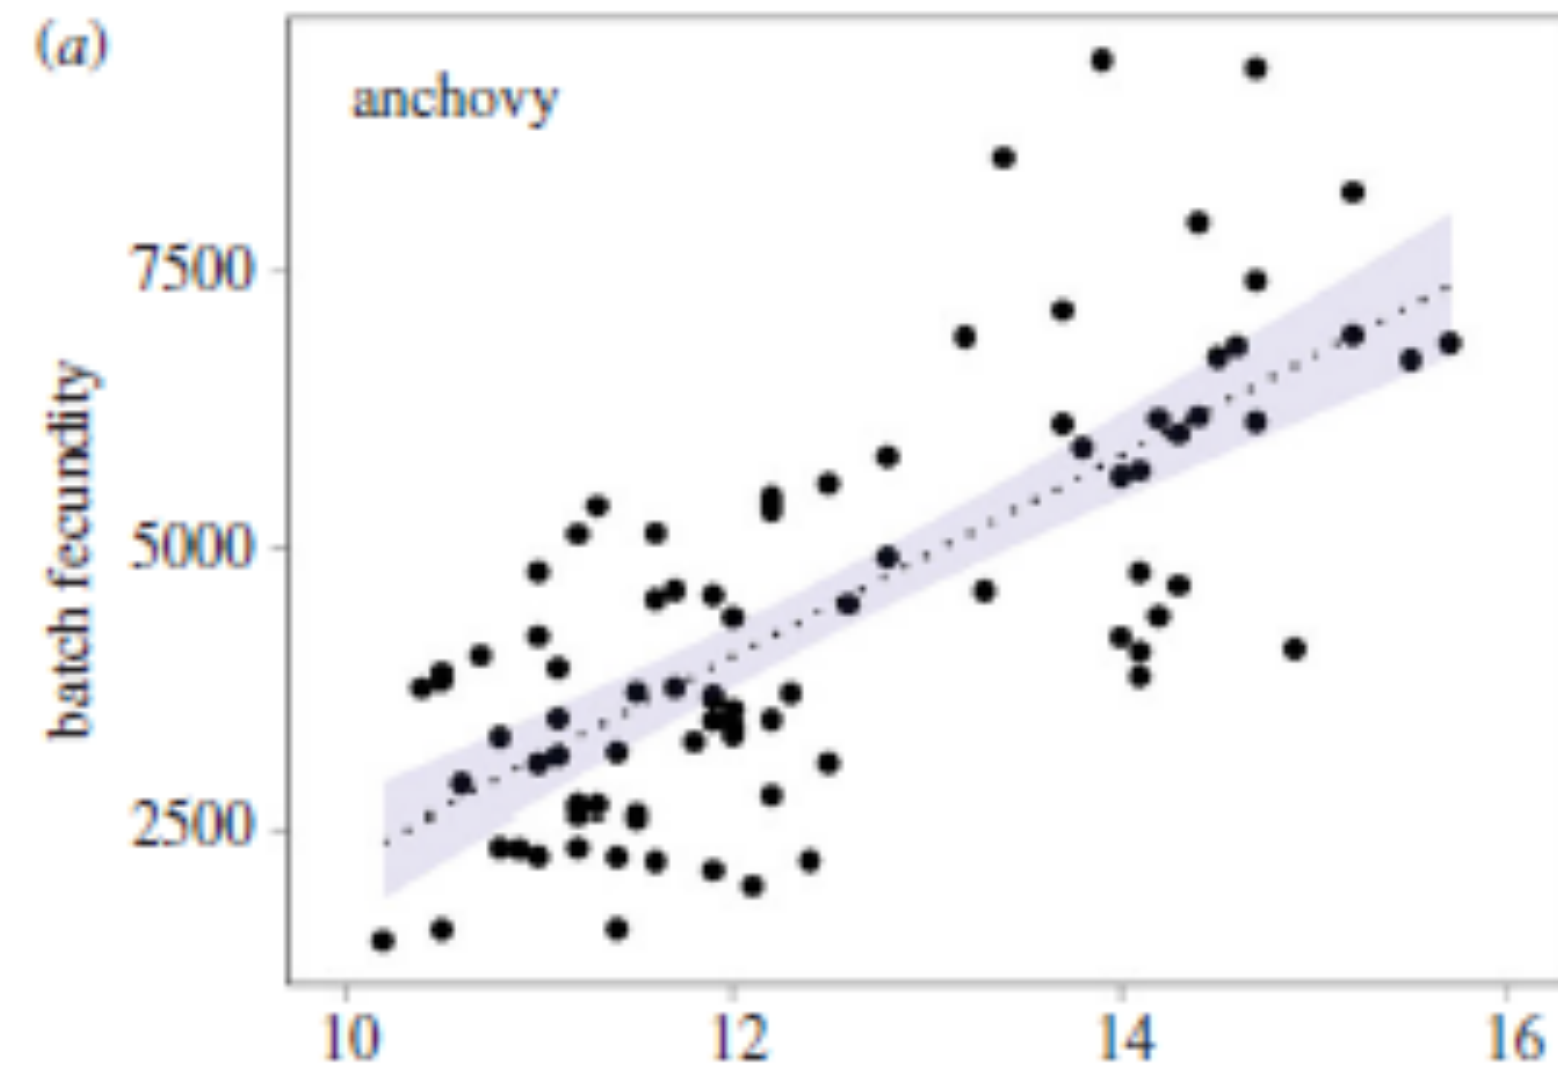

Body conditions

Time series of monthly body condition from 1975 to 2012 derived from fisheries data in the Adriatic Sea displayed long term decreases. A first drop occurred in the mid-80s for both species. It is followed by a slight decrease (1995) and increase (2005) for anchovy and a final decrease between 2008 and 2012 only for sardine,

Small pelagic fish body condition is known to be primarily affected by food availability, especially the zooplanktonic compartment which constitutes the bulk of small pelagic fish preys

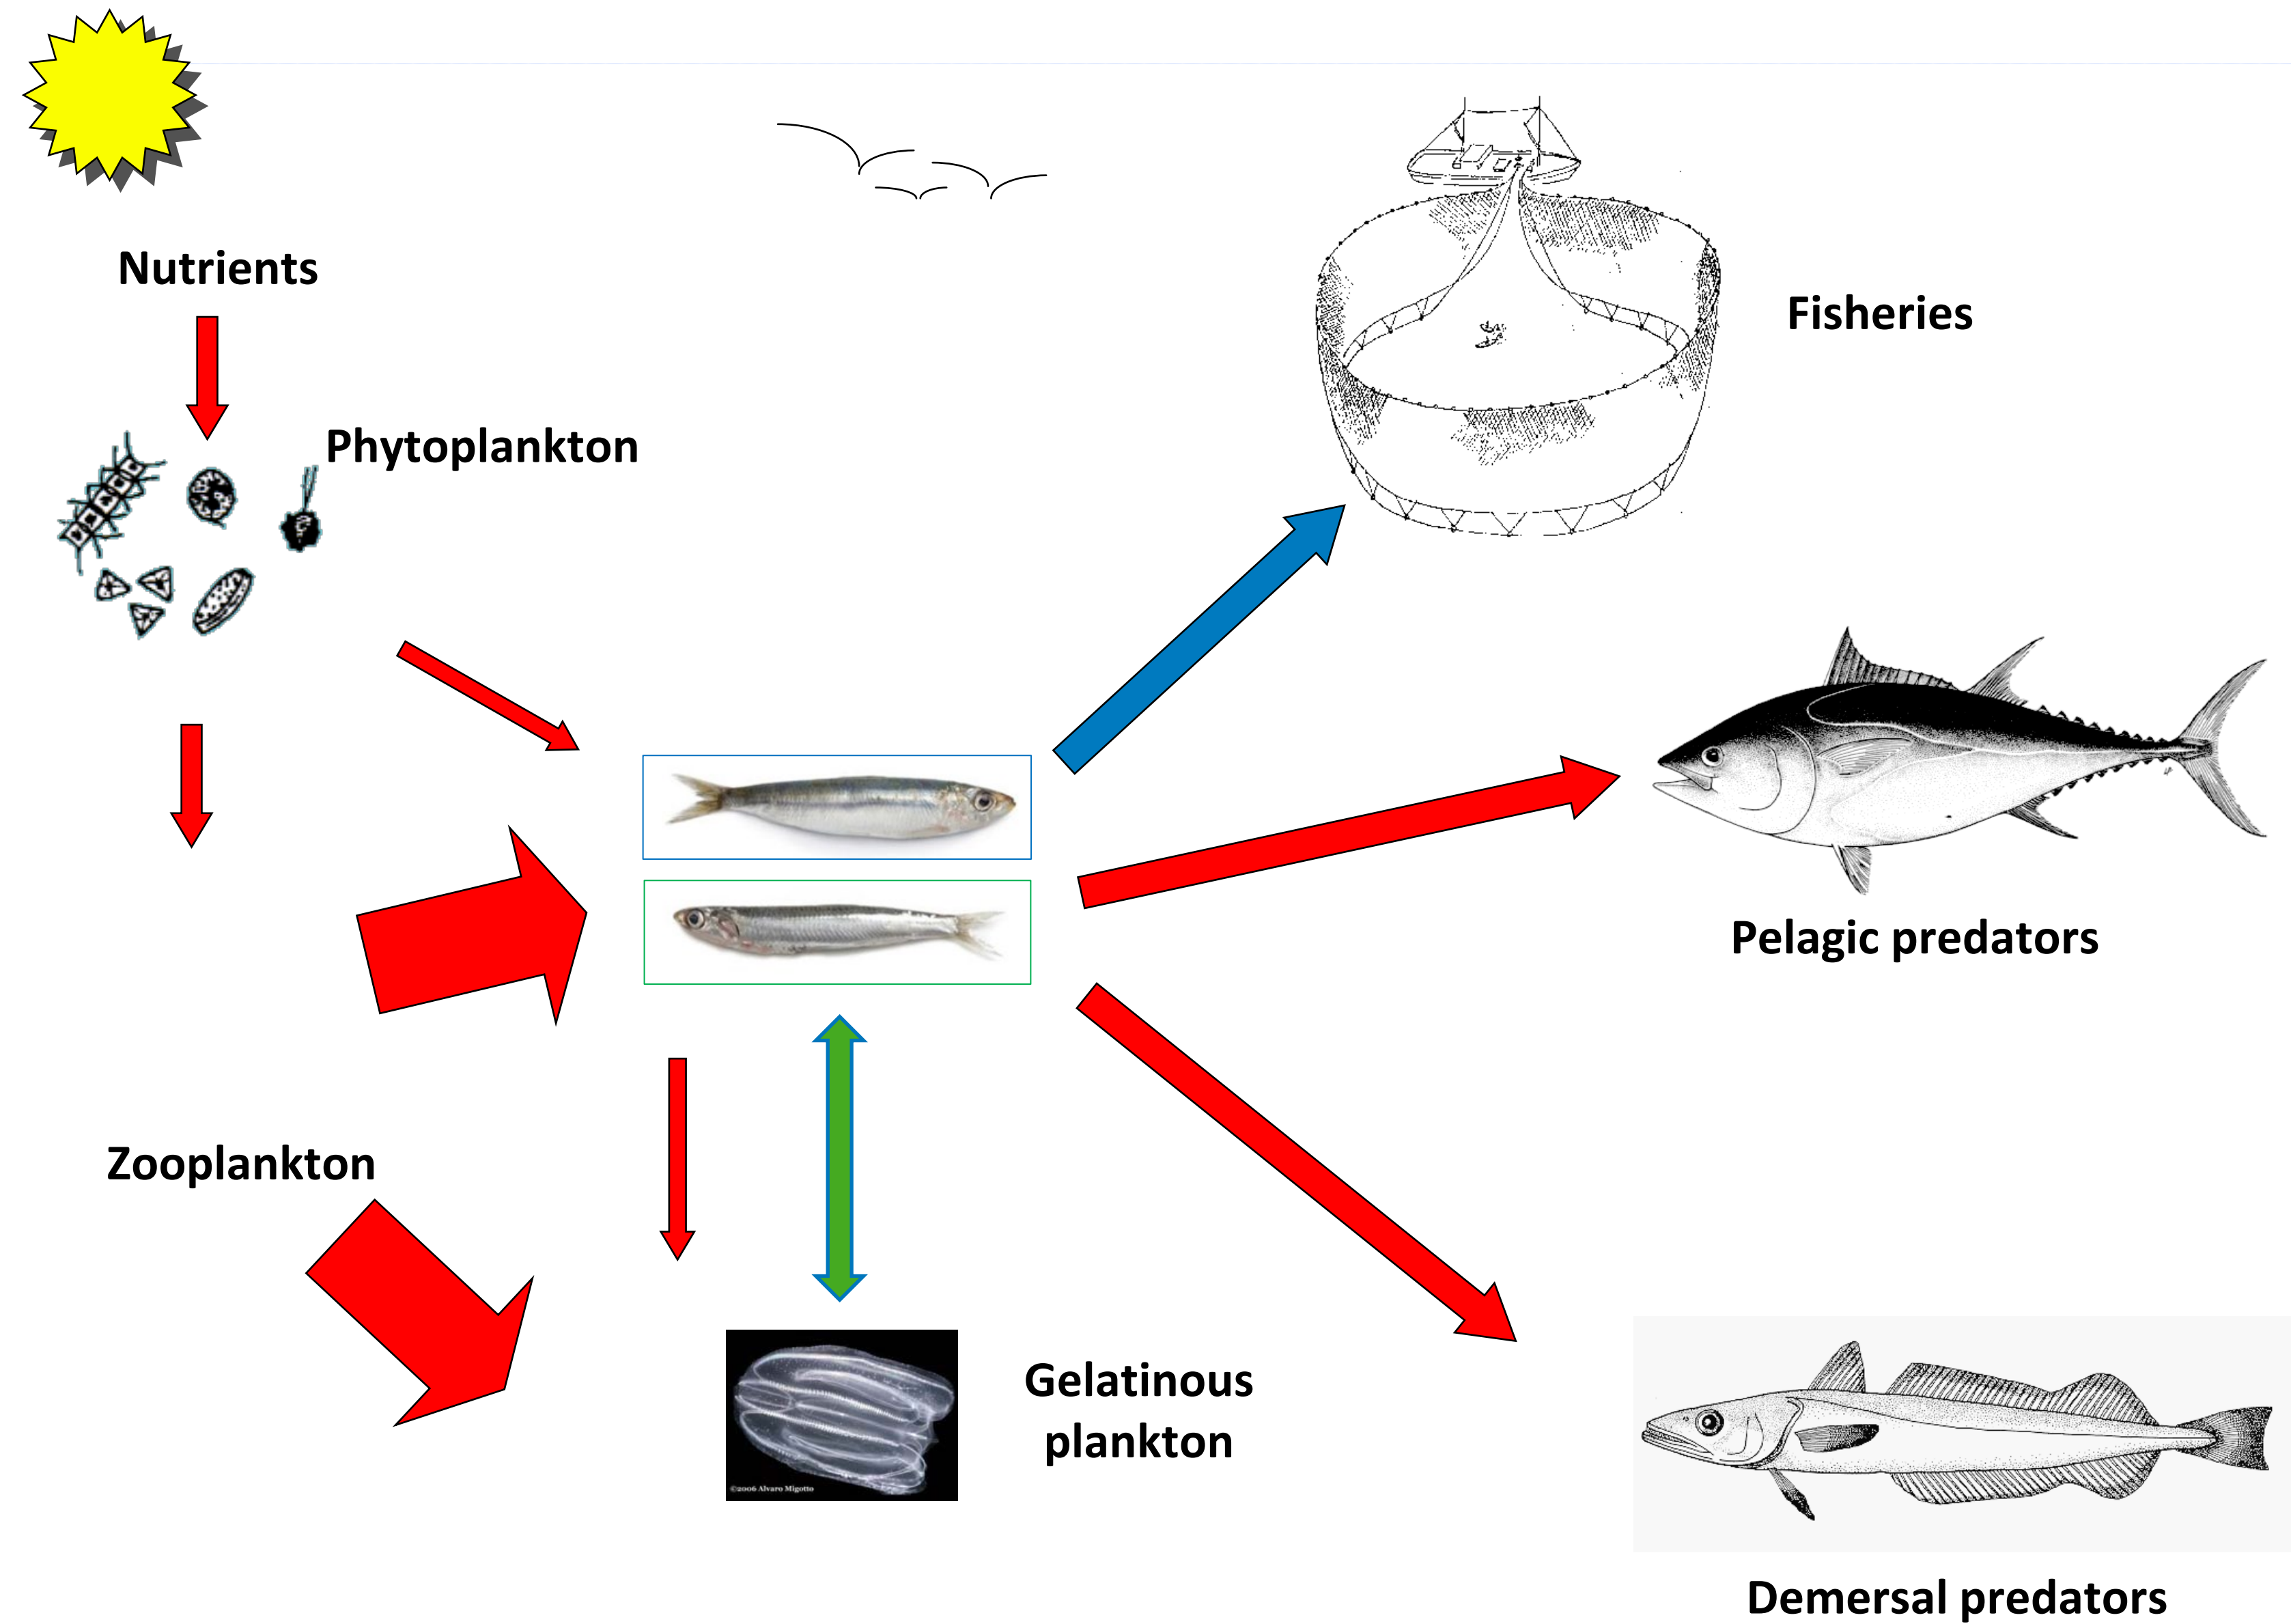

Fecundity and size

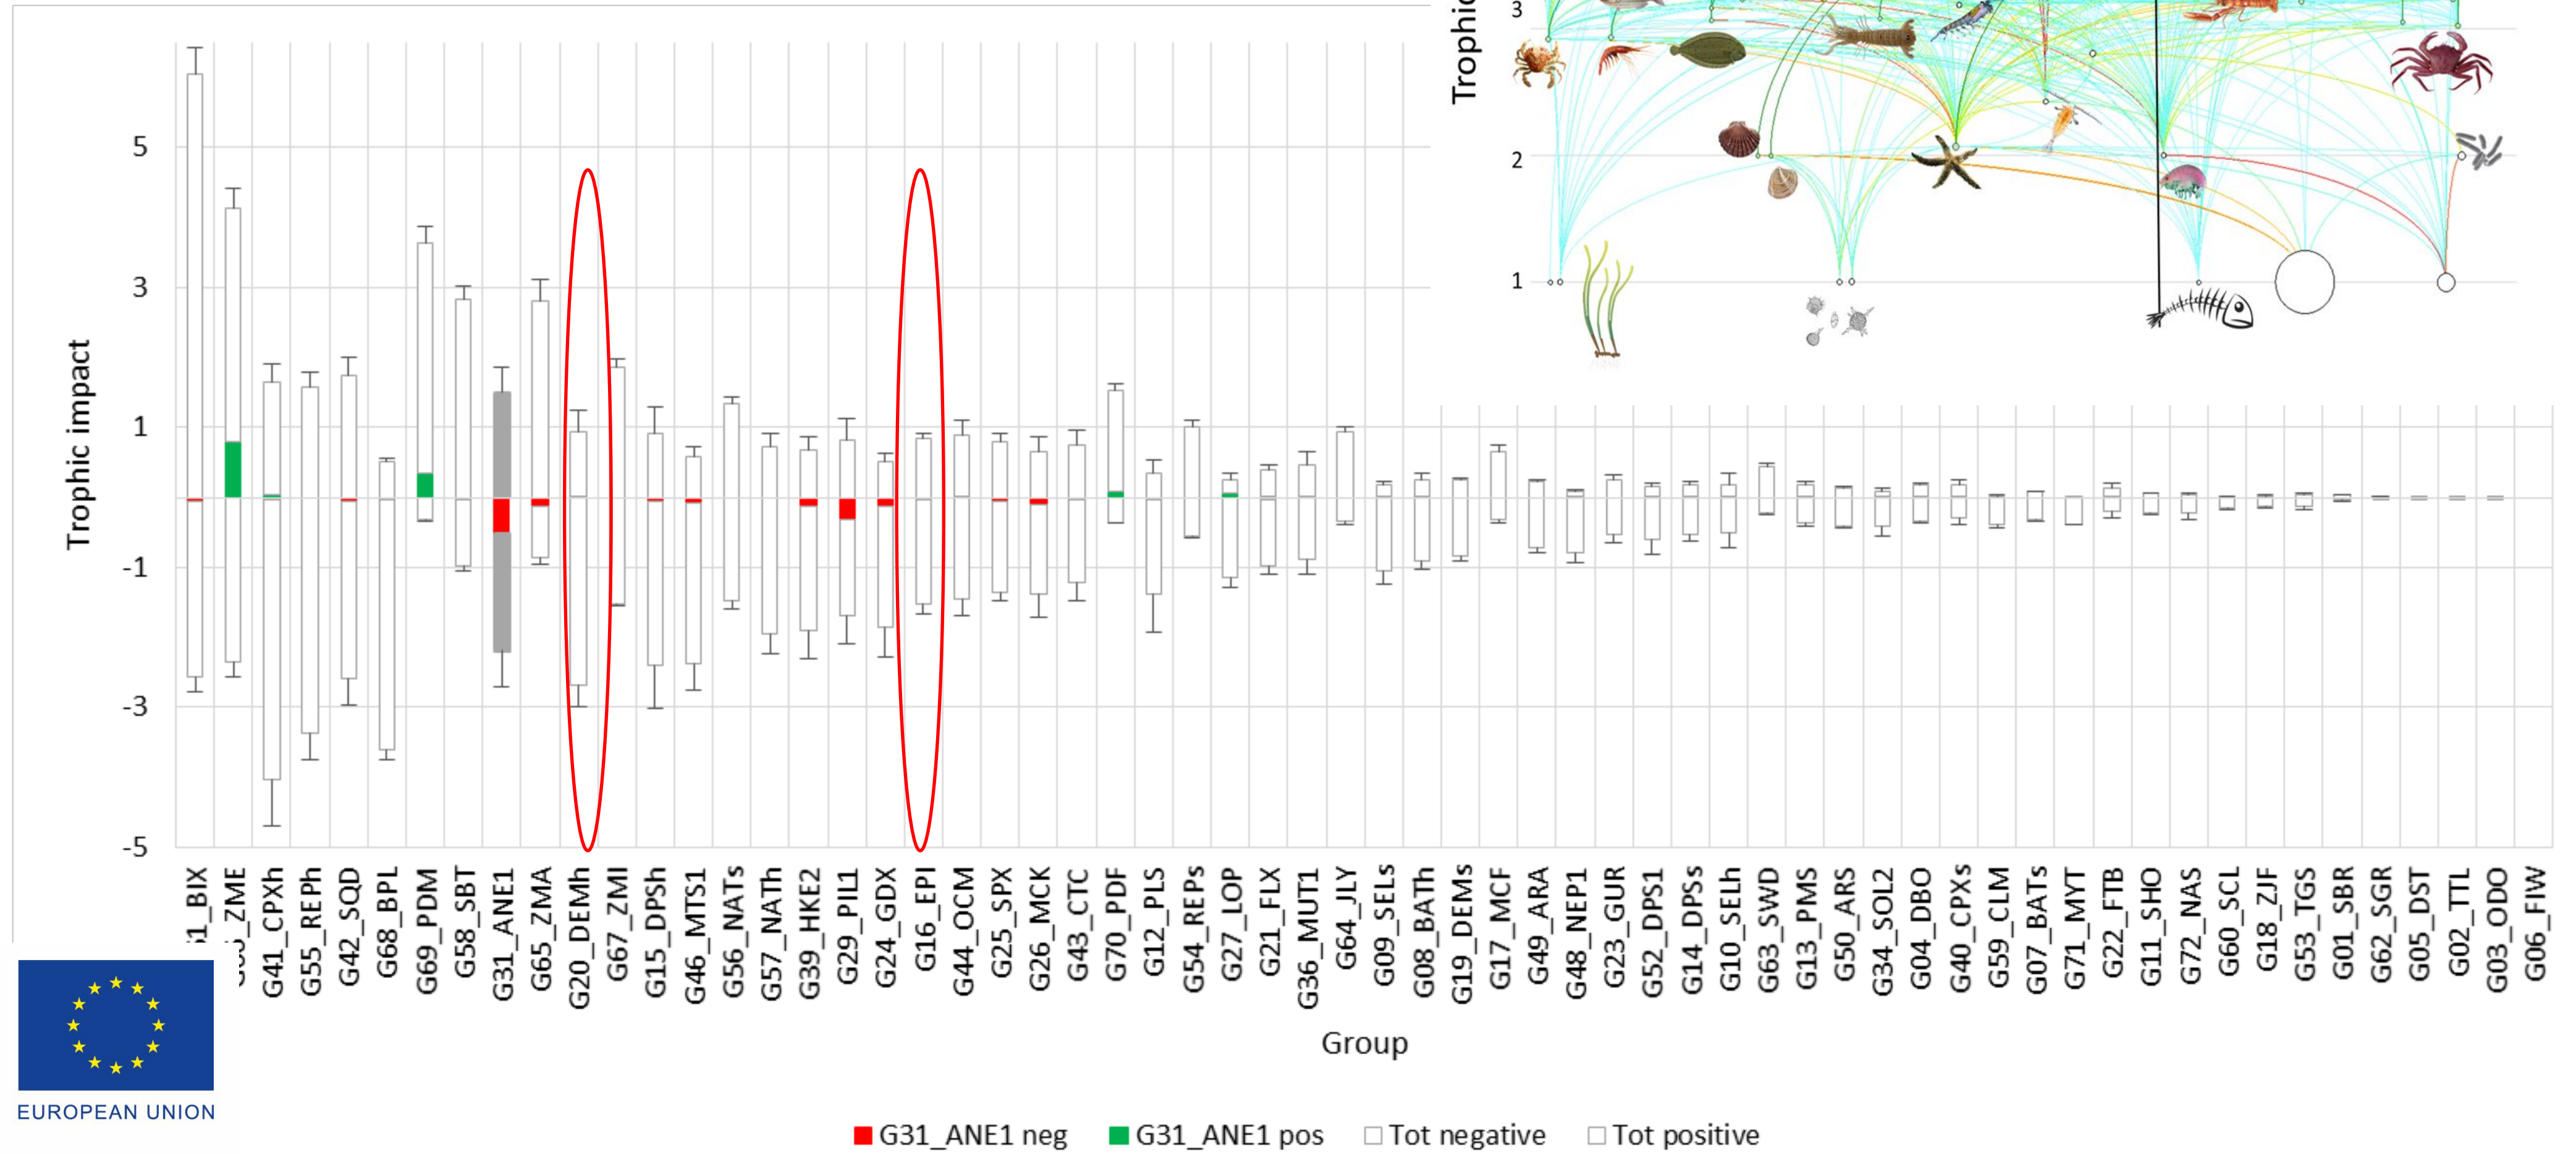

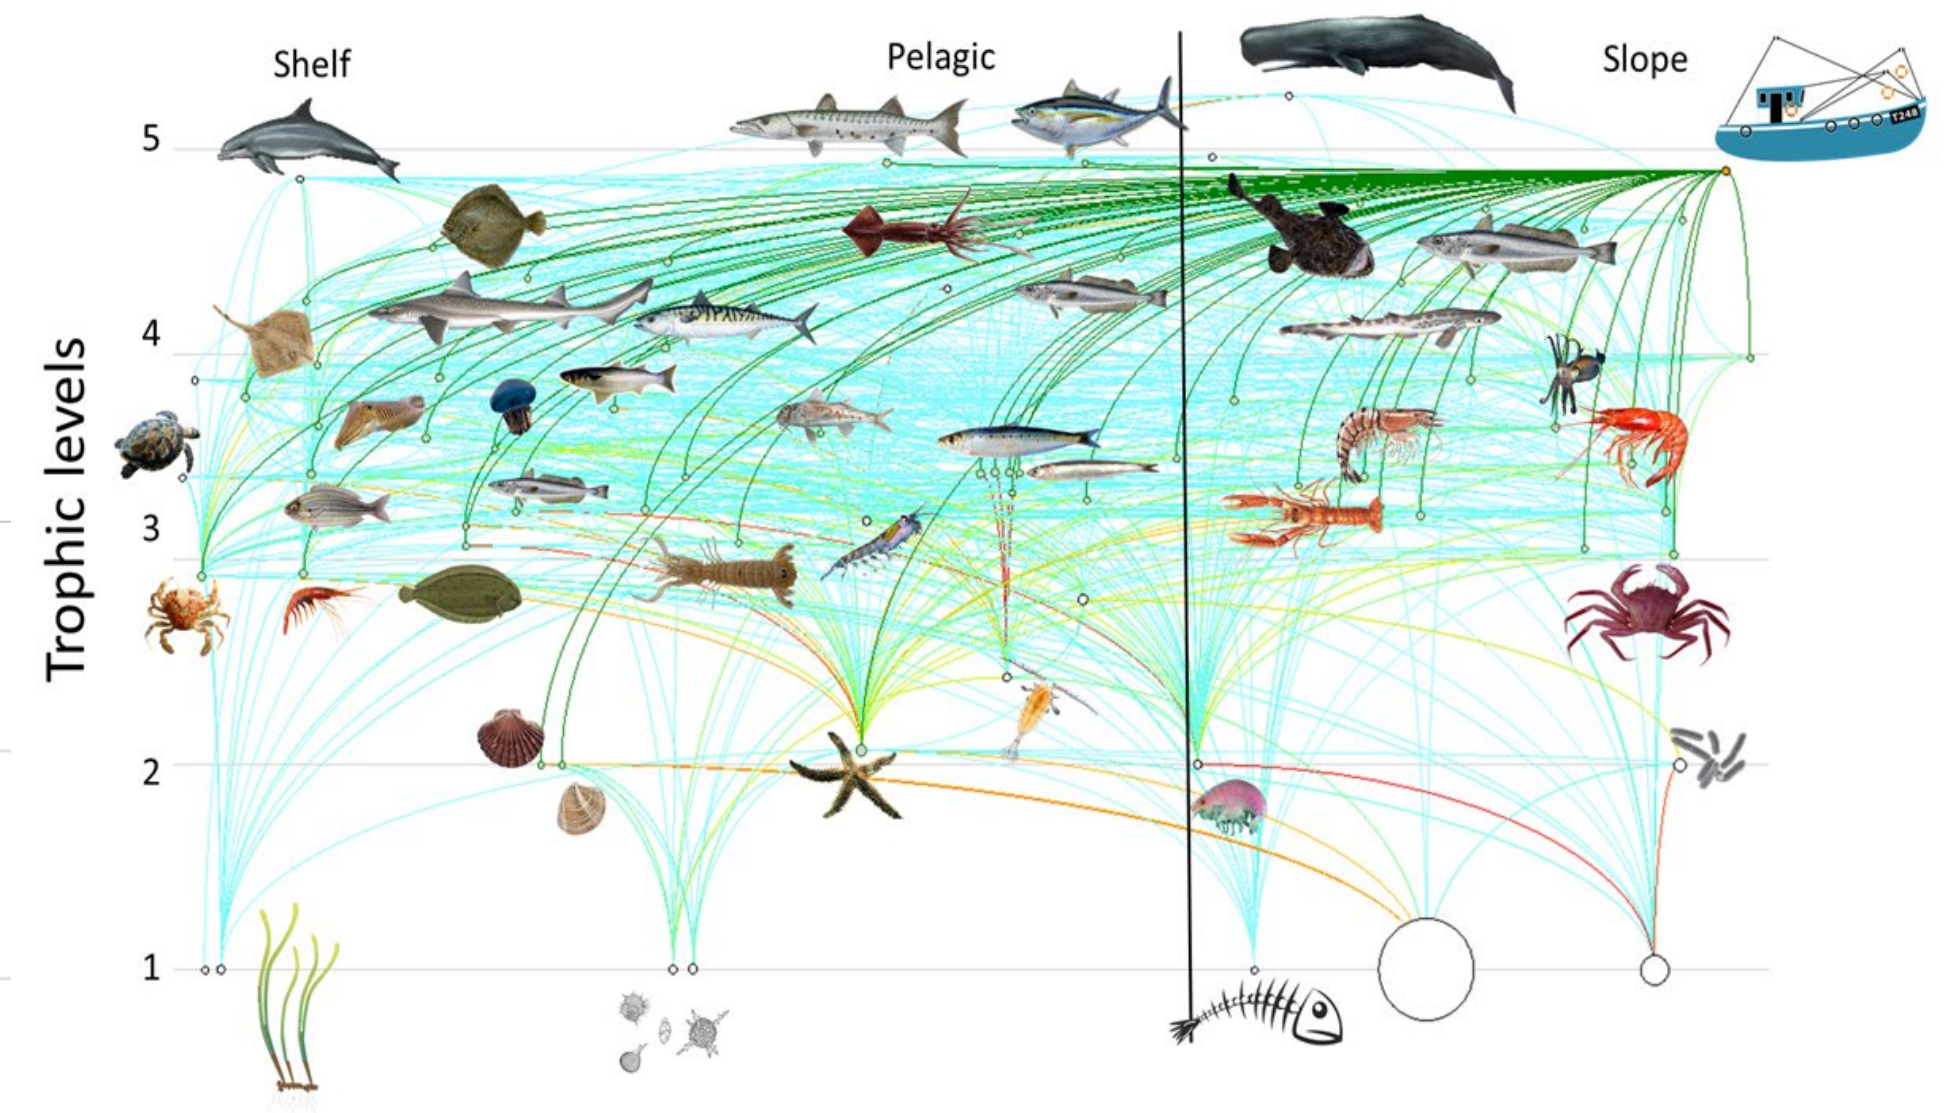

The size decline of small pelagics, whatever is the reason, is a matter of great concern and need precautionary choices...

Brosset et al., 2016

Role of small pelagics in the food web

Quantified role of small pelagics in the food web

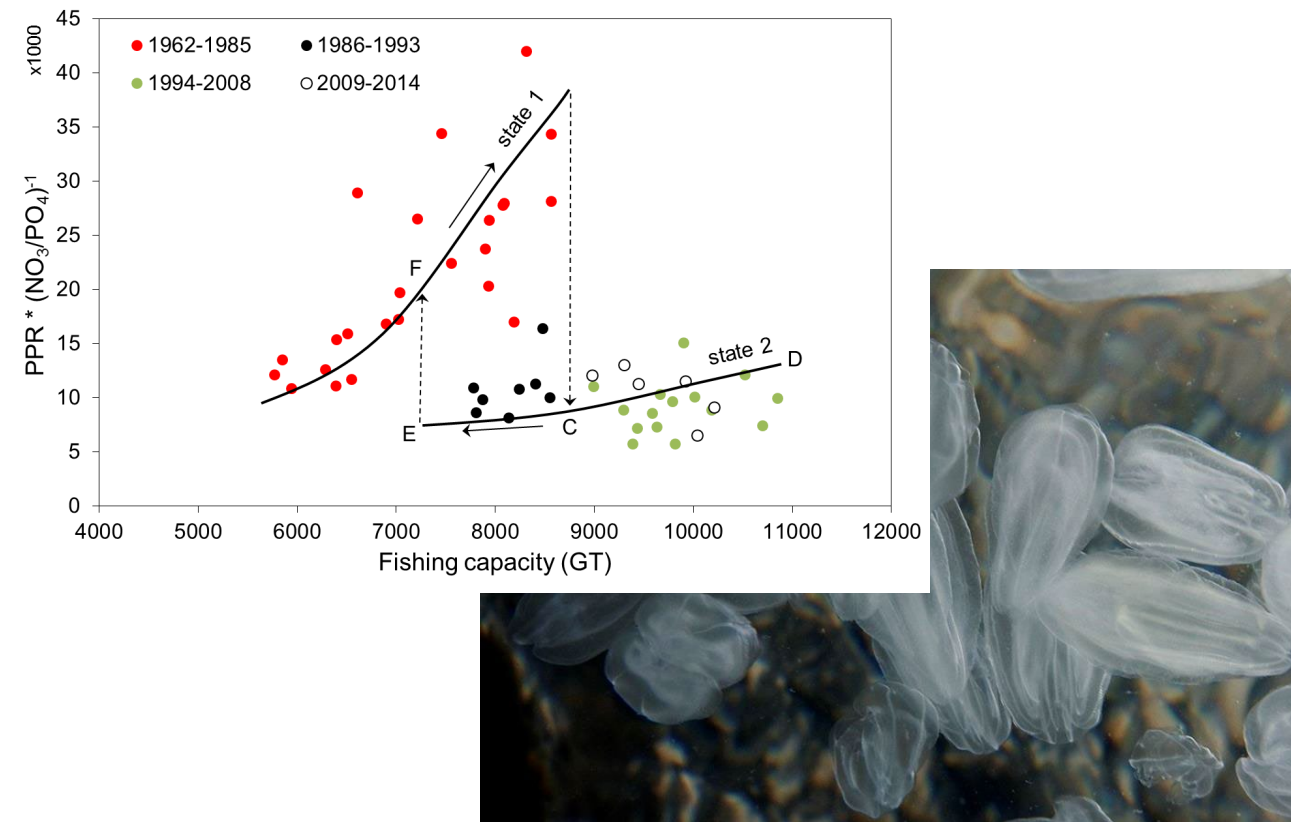

Quantified role of fisheries in the ecosystem

Sustainability of exploitation of small pelagics

Dynamics of small pelagis is largely dependent on oceanographic conditions, that can change also because of climatic changes

Nutrient loads from coastline are potentially impacting the productivity dynamics and thus the biomass at sea. Other stressors are active in the basin (Mnemiopsis)...conditions are really critical for small pelagics...

Body size and body conditions decline is a remarkable sign of critical situation but disentangling the role of different factors in current perceived dynamics is difficult

Although their exploitation from the ecosystem point of view small pelagics have a key role in food webs (also for predators), : a precautionary approach is needed!

Establishment of the SP operators' pilot group for testing the ITACA Web APP

Virtual meeting 23rd September 2021

LP - Veneto Agricoltura 

PP5 – Confcooperative Veneto 

ITACA at a glance

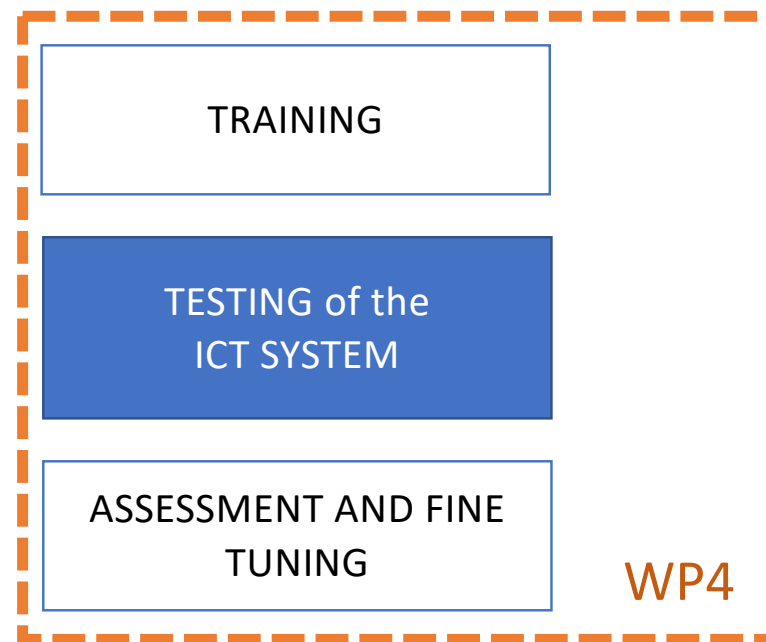

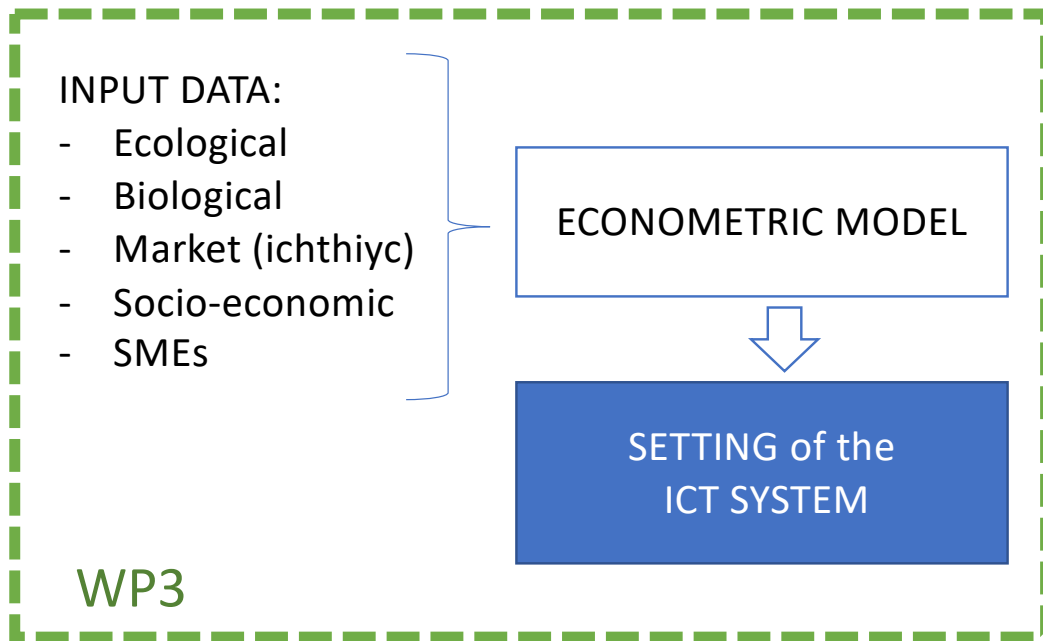

Axis 1: Blue Innovation

- ✓ FISHERIES SMEs;
- ✓ INCREASE OF MARKET OPPORTUNITY;
- ✓ INNOVATION OF PROCESS;
- ✓ ENVIRONMENTAL but MOSTLY SOCIO-ECONOMIC SUSTAINABILITY

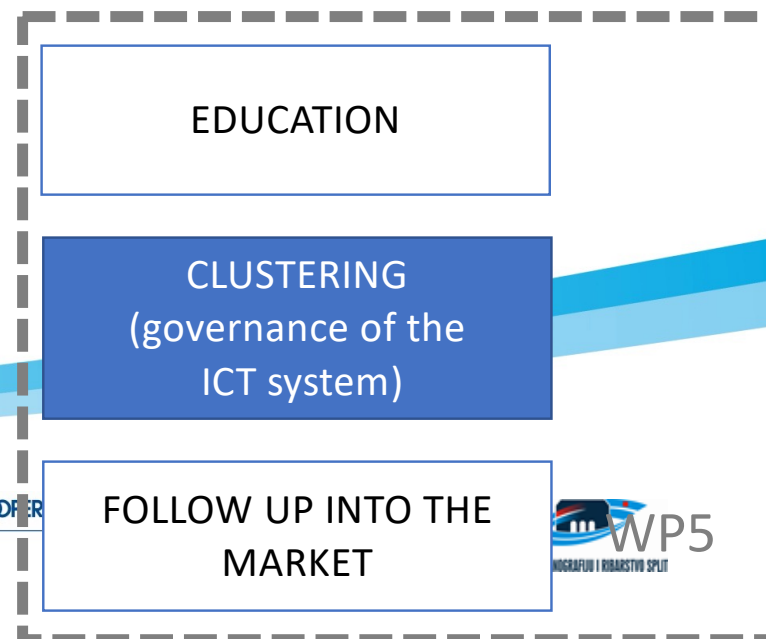

Duration: 42 months, from 01.01.2019 to 30.06.2022

Partnership: Veneto Agricoltura, CNR-IRBIM, International Centre For Advanced Mediterranean Agronomic Studies, Public Institution RERA Sd For Coordination and Development of Split-Dalmatia County, Agency for Rural Development of Istria, Confcooperative - Regional Union Of Veneto, Institute of Oceanography and Fisheries

The ITACA APPROACH: focus on SMEs

GOVERNANCE OF ITACA CLUSTER DURING PILOT ACTION

GOVERNANCE: CLUSTER MANAGEMENT BODY

MANAGER OF THE CLUSTER: LP - Veneto Agricoltura

- *Owner of the WebAPP*
- *Public body*
- *General management and coordination of the cluster and its participants*
- *Supervision and monitoring of activities*
- *Owner and manager of the data (final check on data)*

RUNNING OF CLUSTER: COORDINATORS

COORDINATORS: ITACA PARTNERS

- *Coordination at national/regional/local level*
- *Coordinate and monitor the data collection by operators at local level*
- *Check collected data and, if the case, correct them*
- *Collect and input official data (EUMOFA + Croatian Ministry data on an annual basis for the model correction)*

RUNNING OF CLUSTER: OPERATORS

OPERATORS

- *Periodical (weekly/monthly) inputting of data on the ITACA WebAPP)*
- *The participation is free of charges*

RUNNING OF CLUSTER: INPUTTING OF DATA

- **DAILY/WEEKLY ECONOMIC MODEL (FOR ITALY)**
 - Data on catches and prices
 - Data input on weekly basis (also daily inputting is possible)
 - Data are inputted by IT operators
- **MONTHLY ECONOMIC MODEL (ALL)**
 - Data on catches and prices
 - Data input on monthly basis (also weekly inputting is possible)
 - Data are inputted by HR operators
 - Official data (EUMOFA + Croatian Ministry data) are inputted by Coordinator on an annual basis for the model correction

For the **biological model**, the data input should be on a daily basis, even if the input could be done with a lower frequency

RUNNING OF CLUSTER: CONSULTATION OF DATA

1. *MANAGER OF THE CLUSTER*

- Total broken down data

Catches and prices
Forecast prices to set up
fishing strategy

2. *COORDINATORS*

- Broken data for territorial level of competence (national or regional)
- Could ask for broken down data to the Manager

3. *OPERATORS*

- Own data
- Aggregated data for the fishing harbour
- Past average price for the total cluster/nation/regions

NEXT STEPs

- ✓ Today: formal establishment of cluster
- ✓ Next days: work closely with partners to start up the pilot action (distribution of formal document + training on web up + devices)
- ✓ First week of October: OFFICIAL START OF THE PILOT ACTION
