AdSWiM rationale

The Adriatic quality of bathing waters (BW) (EEA Reports 2016 on European bathing water quality) is generally high. But this quality have to be maintained and further improved.

Critical situations in the Adriatic have been spotted out both near the urban areas or close to the rivers where wastewater is discharged after depuration (Piano Regionale di Tutela delle Acque, Water Protection Regional Plan for FVG, Environmental Reports-Regione Veneto).

Unbalanced nutrients ratio, microbiological risk, pollutants discharged into the marine environments represent a risk for both the hygienic quality of the bathing water and the ecosystem stability

AdSWiM challenge

Protection and/or restoration of the receiving bodies of water/sea setting up a **crossborder cooperation project**, whose aim is to turn into a useful element any possible criticality coming from the drainage of treated UWW.
